

Setting Research Agendas at the National Level

Dr. Erwin Gianchandani
Director, Computing Community Consortium
Computing Research Association

UVA Sources for Scholars
Sept. 10, 2010, Alumni Hall

Today's topic

"The place of research at R1 universities in their mission as educators as well as creators and discoverers of new knowledge from your perspective directing CCC."

My background...

A Triple Hoo goes to Washington

B.S., computer science, 2005
M.S., biomedical engineering, 2007
Ph.D., biomedical engineering, 2009

AAAS Science & Technology Policy Fellow
Directorate for Computer & Info. Sci. & Eng. (CISE)
"Smart health & wellbeing" initiative
Fall 2009 & spring 2010

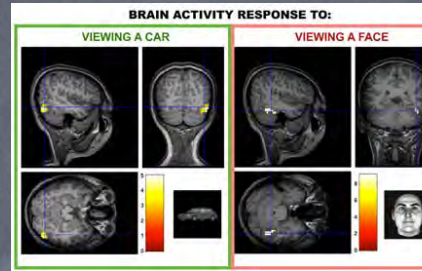

Director, Computing Community Consortium
Since April 2009

Basic research is the
bedrock of our future

Advances have changed the world...

How we live,
work, learn, and
communicate.

Google

...Research has built the foundation...

...And the future is full of opportunity

- Driving advances in all fields of science and engineering
- Pursuing digital scholarship
- Improving quality of life through personalized health monitoring
- Revolutionizing transportation
- Personalizing education
- Creating a smart grid
- Assessing and mitigating the effects of climate change
- Empowering the developing world

But we must work together...

to establish, articulate, and pursue audacious visions

- The challenges that will shape the intellectual future of the field
- The challenges that will catalyze research investment and public support
- The challenges that will attract the best and brightest minds of a new generation

So how do we do it?

Audacious visioning requires...

- Aligning ourselves with Federal government interests
- Being agile and flexible
- Bringing leading researchers together
- Being willing to take risks & fail
- Let's take a look at a couple examples...

Computing was at a crossroads...

- In the mid-2000s, NSF leaders and computing research leaders had similar deep concerns
 - The Federal commitment to research in general, and to computing research in particular
 - Public and policymaker perception that “computer science” is “yesterday’s news”
 - Failure to articulate and coalesce around exciting research visions in computer science that could galvanize the public, policymakers, researchers, and students
 - Need to groom the future leadership of the field
 - Decrease in student interest

...So something was done about it

- Increased focus by NSF leaders and computing research leaders in academia & industry
- A Computing Community Consortium solicitation & proposal
 - “[NSF] will support the CCC as a community proxy responsible for facilitating the conceptualization and design of promising infrastructure-intensive projects...”
 - “The purpose of the CCC is to provide a voice for the national computing research community. The CCC will **facilitate** the development of a bold, multi-themed vision for computing research and education... [communicating] that vision to ... major stakeholders.”

NSF asked CRA to create a "CCC"

- To catalyze the computing research community to consider such questions
 - To envision long-range, more audacious research challenges
 - To build momentum around such visions
 - To state them in compelling ways
 - To move them towards funded initiatives
 - To ensure "science oversight" of large-scale initiatives
- A "cooperative agreement" with NSF
 - Close coordination

The CCC Council: a broad slice

- **Director:** Erwin Gianchandani

- **Chair:** Ed Lazowska

- **Terms ending 2013**

- Randy Bryant
- Lance Fortnow
- Hank Korth

OSTP's FY 12 priorities...

THE DIRECTOR

EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF MANAGEMENT AND BUDGET
WASHINGTON, D.C. 20503

July 21, 2010

M 10-30

MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

FROM: Peter R. Orszag *Orszag*
Director, Office of Management and Budget
John P. Holdren *Holdren*
Director, Office of Science and Technology Policy

SUBJECT: Science and Technology Priorities for the FY 2012 Budget

Scientific discovery, technological breakthroughs, and innovation are major engines for expanding the frontiers of human knowledge and are indispensable for promoting sustainable economic growth, improving the health of the population, moving toward a clean energy future, addressing global climate change challenges, managing competing demands on the environment, and safeguarding our national security.

This memorandum follows up on OMB Memorandum M-10-19 by outlining the Administration's science and technology (S&T) priorities for formulating FY 2012 Budget submissions to the Office of Management and Budget (OMB). These priorities for research and development (R&D) investments and other S&T investments build on priorities already reflected in the American Recovery and Reinvestment Act, the FY 2010 and 2011 Budgets, and key Administration policy guidance such as the President's *Strategy for American Innovation*. This memorandum also provides program guidance for S&T activities in Executive Departments and Agencies.

Prioritizing key S&T activities

"In the 2012
focus on ...

- Economic
- NIT

- Achieving

- Moving to

- Impacts of

- Improved

- National

- Cybersecurity

job creation

"inferences from
enormous quantities of data"

better health outcomes

clean energy future

climate change

sustainability

...Aligning our activities

"In the 2012 Budget, agencies should focus on ... six challenges."

- Economic growth and job creation
 - NITRD -- "inferences from enormous quantities of data"

Data analytics WPs

Big data visioning activity

NSF CDI

- Achieving better health outcomes

Health IT workshop

ONC discussions

NSF/CISE SHB

NIH discussions

- Moving toward a clean energy future

Multiple WPs

- Impacts of global climate change

NSF CRI

- Improved sustainability and biodiversity

NSF SEES

- National security

Multiple WPs

- Cybersecurity

Where can we contribute?

Signs of a health IT R&D initiative?

Computing Community Consortium
We support the computing research community in creating compelling research visions and the mechanisms to realize these visions.

HOME | YOUR VISION | PLANS | **ACTIVITIES** | RESOURCES | ABOUT | CRA |

Discovery and Innovation in Health IT

This invitation only workshop, "Discovery and Innovation in Health IT," is sponsored by the National Science Foundation, the Office of the National Coordinator for Health Information Technology, the National Institute of Standards and Technology, the National Library of Medicine, the Agency for Healthcare Research and Quality, the Computing Community Consortium, and the American Medical Informatics Association. It will be held at the **Parc 55 Hotel** in San Francisco on **October 29 and 30, 2009**.

The talks and plenary discussions will be videotaped and a web presence will be developed to make the workshop material broadly available.

The goals of the workshop are to:

- Explore and define fundamental research challenges and opportunities in healthcare IT in both the near- and long-term;
- Provide opportunities for relevant academic and industrial researchers, healthcare practitioners and IT healthcare suppliers to identify mutual interests in healthcare IT, as they relate to both near- and long-term challenges and solutions;
- Identify a range of "model" proof-of-concept, integrative systems that might serve as motivating and unifying forces to drive fundamental research in healthcare IT and accelerate the transition of research outcomes into products and services;

The workshop will have four half-day sessions. Each of the first three sessions will have two plenary talks followed by small-group breakout discussions to define particular research challenges, multiple lines of attack, and possible test-beds or demonstration systems. Each of these sessions, which are further described subsequently, will end with short reports from the

(A) interfaces between human information and communications technology systems;
(B) voice-recognition systems;
(C) software that improves interoperability and connectivity among health information systems;
(D) software dependability in systems critical to health care delivery;
(E) measurement of the impact of information technologies on the quality and productivity of health care;
(F) health information enterprise management;
(G) health information technology security and integrity; and
(H) relevant health information technology to reduce medical errors.

SEC. 3. PURPOSES AND PRINCIPLES.
(a) STATEMENT OF PURPOSES.—The purposes of this Act include the following:

San Francisco, CA

On Feb. 17, 2009, Congress passed the American Recovery & Reinvestment Act.

The legislation included language specifically calling for Health IT research.

And program staff at NSF immediately sought to run an interdisciplinary workshop.

Workshop to white papers

Information Technology Research Challenges for Healthcare: From Discovery to Delivery¹

Susan Graham (University of California, Berkeley)², Deborah Estrin (University of California, Los Angeles), Eric Horvitz (Microsoft Research), Isaac Kohane (Harvard University), Elizabeth Mynatt (Georgia Institute of Technology), Ida Sim (University of California, San Francisco)

Wellness and healthcare are central to the lives of all people, young or old, healthy or ill, rich or poor.

“NSF’s investment in healthcare research is essential in order for the opportunities [to enhance wellness, healthcare, and the clinical sciences] to be realized.”

subtle but important causal signals in the fusing of clinical, behavioral, environmental, genetic, and

“The importance of collaboration between information technology researchers, social scientists, and biomedical researchers is an essential component of the research agenda we have laid out.”

to strengthen the uses of information technology that are already underway in healthcare and in other domains.

From Data to Knowledge to Action: Enabling Evidence-Based Healthcare

The National Academies’ Report “Computational Technology for Effective Health Care: Immediate Steps

The SHARP program

- Announced in December 18, 2009, with a late-January deadline for submission
- Run by Office of the National Coordinator for Health IT in HHS, not NSF
- Focused on “breakthrough advances ... to the adoption and meaningful use of health information technology”
- Four awards totaling \$60 million announced in March 2010

But the seeds had been planted...

The screenshot shows the NSF website with the header "National Science Foundation WHERE DISCOVERIES BEGIN". A search bar is in the top right. A navigation bar includes links: HOME, FUNDING, AWARDS, DISCOVERIES, NEWS, PUBLICATIONS, STATISTICS, ABOUT, and FastLane. On the left, a "Funding" sidebar lists links like "Find Funding", "A-Z Index of Funding Opportunities", "Recent Funding Opportunities", "Upcoming Due Dates", "Advanced Funding Search", "Interdisciplinary Research", "How to Prepare Your Proposal", "About Funding", "Proposals and Awards", "Proposal and Award Policies and Procedures Guide", "Introduction", "Proposal Preparation and Submission", "Grant Proposal Guide", "Grants.gov Application Guide", "Award and Administration", and "Award and Administration Guide". The main content area is titled "Smart Health and Wellbeing (SHW)" and includes "Email", "Print", and "Share" icons. Below the title, there are sections for "CONTACTS" (with the text "See program guidelines for contact information.") and "SYNOPSIS". The synopsis text reads: "Information and communications technologies are poised to transform our access to and participation in our own health and well-being. The complexity of this challenge is being shaped by concomitant transformations to the fundamental nature of what it means to be healthy. Having good health increasingly means managing our long-term care rather than sporadic treatment of acute conditions; it places greater emphasis on the management of wellness rather than healing illness; it acknowledges the role of home, family, and community as significant contributors to individual health and wellbeing as well as the changing demographics of an increasingly aging population; and it recognizes the technical feasibility of diagnosis, treatment, and care based on an individual's genetic makeup and lifestyle. The substrate of 21st century healthcare will be computing and networking concepts and technologies whose transformative potential is tempered by unresolved core challenges in designing and optimizing them for applicability in this domain." Below this, it states: "The goal of the Smart Health and Wellbeing program is to seek improvements in safe, effective, efficient, equitable, and patient-centered health and wellness services through innovations in computer and information science and engineering. Doing so requires leveraging the scientific methods and knowledge bases of a broad range of computing and communication research perspectives." The final paragraph begins: "Some illustrative examples are described here. Protecting patient privacy while providing legitimate anytime, anywhere access to health services will require new security and cryptographic solutions. Personalized medicine will require advances in information retrieval, data mining, and decision support software systems. Continuous monitoring and real-time, customized feedback on health and behavior will rely on remote and networked sensors and actuators, mobile platforms, novel interactive

A program within
NSF/CISE on "smart
health & wellbeing"
for FY 11.

...And there's hope for more yet

- A cross-cutting initiative within NSF (including ENG, SBE, and CISE) for FY 12?
- Involvement of other relevant agencies, such as NIH, AHRQ, CDC, FDA, and the Office of the National Coordinator for Health IT?

Astronomy's decadal survey...

- Every 10 years, astronomers release a "decadal survey" recommending which astronomy & astrophysics projects should be funded by the government
- The 2010 survey was the result of 9 appointed panels, 17 town hall meetings, and 324 white papers

...Speaks with a unified voice...

- 2010 report not merely a “wish list”
- Identified 8 projects, all focused on the study of dark matter & dark energy
- Included independently vetted estimates of project costs

...And serves as another model

NEWS

NATURE | 11 August 2011

US survey sets cosmic priorities

Dark energy rises to the top in decadal report ranking future astronomy and astrophysics projects.

Recently, a colleague of astronomer Claire Max jokingly told her that, come 13 August, half her friends would love her and half would never want to speak to her again.

That is because Max, of the University of California, Santa Cruz, has for the past two years been helping to craft US astronomy's latest decadal survey, an influential report prepared for the National Research Council that recommends which astronomy and astrophysics projects NASA, the National Science Foundation (NSF) and the Department of Energy (DOE) should fund over the next ten years.

Using input from 9 appointed panels, 17 town-hall meetings and 324 white papers from individual research groups, the survey's aim is to assess opportunities and set priorities for US astronomy and astrophysics, while balancing scientific goals with fiscal realities. The report is now out, and although Max isn't aware of losing any friends, there are some in the community who have more reason to thank her than others.

Topping the list of the pleased and grateful is Anthony Tyson, an astrophysicist at the University of California, Davis, and director of the proposed Large Synoptic Survey Telescope (LSST), which ranks highest among the ground-based facilities considered by the survey committee. When completed in 2015, the 8.4-metre telescope will regularly sweep the entire visible sky in three nights with a 3.2-gigapixel camera, capturing short-lived phenomena ranging from fast-moving near-Earth asteroids to the flashes of supernovae in distant galaxies.

Over ten years, the US\$465-million observatory will also build up an unprecedented

100-petabyte database for astronomers trying to discern the nature of two mysterious factors that shape the Universe. One is dark matter, thought to be an unknown particle or family of particles beyond the standard model of physics. Hidden in vast quantities among the galaxies, dark matter generates a gravitational pull that has shaped the evolution of the Universe. The other factor is dark energy, the pervasive but mysterious phenomenon that is causing cosmic expansion to accelerate. Crucial data on both

factors can be derived from a three-dimensional survey of the surrounding Universe that the LSST is well suited to provide.

"Increasingly, we are able to ask new questions by querying huge databases," says Tyson. "The key is to populate those databases with calibrated and trusted data."

The LSST is expected to help US astronomers regain some momentum in ground-based

The Large Synoptic Survey Telescope will capture short-lived cosmic events.

astronomy at a time when European facilities have begun to dominate the field. To that end, the survey stresses the need for a swift decision on which of two competing mega-telescopes should receive federal funding.

The proposed Thirty Meter Telescope, on Mauna Kea in Hawaii, and the Giant Magellan Telescope, envisioned for Las Campanas in Chile, are both supported by significant private money, and would have many times the light-gathering power and resolution of today's largest telescopes. Realistically,

only one project will receive federal funds, which the survey recommends should be between \$257 million and \$350 million. Given that Europe has also prioritized a 42-metre telescope, the European Extremely Large Telescope, a choice needs to be made now to avoid a counterproductive stalemate.

In space, the decadal survey proposes the Wide Field Infrared Survey Telescope (WFIRST), a 1.5-metre instrument that will map the whole sky at near-infrared wavelengths.

Such data would contain subtle clues — in the distance-brightness relationships of supernovae, the bending of light (microlensing) from background galaxies and the three-dimensional clustering of matter in space — that can be used to independently measure dark energy.

WFIRST is effectively a rebranding of the Joint Dark Energy Mission, a NASA-DOE collaboration. The new name, says one survey reviewer, signals that the \$1.6-billion telescope is not a one-trick pony, but a way of serving other astronomical needs as well. The survey committee stresses, for example, that WFIRST could spot microlensing events caused when exoplanets — planets outside our Solar System — pass briefly in front of background stars in the Milky Way. Although the method is unsuitable for studying individual solar systems in detail, it promises, through its sheer number of discoveries, to provide an unbiased sample of the kinds of planetary systems prevalent in the Galaxy.

This may not be enough to satisfy those who study exoplanets. "I don't think the report reflects that activity and the amount of young people going into exoplanets," says Sara Seager, an astrophysicist at the Massachusetts Institute of Technology in Cambridge. Seager notes that the survey abandons support for the Space Interferometry Mission, a project that would have detected planets slightly larger than Earth through their gravitational effect on the stars they orbit. However, Seager applauds another recommendation: a \$100-million to \$200-million allocation for the technical development of a future exoplanet mission.

Exoplanet researchers were stung when the Terrestrial Planet Finder, a mission endorsed by the previous decadal survey was later cancelled owing to cost overruns. So they welcome the chance to continue pursuing other approaches to observing Earth-like planets.

"Last week, I was worried," says Webster Cash, who is working on an exoplanet-mission concept at the University of Colorado, Boulder. "Now, I'm feeling like my career is going to be a lot of fun for the next ten years."

Adam Mann

See Editorial, page 908. For a full list of ranked projects, see go.nature.com/BrYV1u.

"...other disciplines planning their own reviews should follow [astronomy's] lead, as [its report] promises to be a steady guide for a bumpy decade ahead..."

Some lessons learned

1. We need to be vocal

- Funding agencies rely on the research community's voice when creating new funding programs
 - Does the community want to work on this problem?
- Workshops are important (not "just another workshop")
 - Bring people together
 - Allow us to understand the issues
- White papers have a role
 - Language makes its way into solicitations!
- It's not always about a new funding program, but rather fostering new links and connections

2. It's about the next generation

- We have to educate today's students to be tomorrow's **leaders**
- Scientific process, research, scholarship, innovation -- all very important
- But so is policymaking and decision-making
- Service and P&T cases

3. Service is important critical

- There's value to serving as a program officer
 - Some fields view this role in higher regard than others
- Learning how DC works can make us better scientists, researchers, and educators
 - We know what to propose and how to propose it
 - We know the skills set required of our graduates
- We must make sure there's a constant stream of people heading to DC -- they become "advocates" for a field
- Stay involved -- even if you can't make it to DC

We must work together today...

Vol 467 | Issue no. 7312 | 9 September 2010

Science scorned

The anti-science strain pervading the right wing in the United States is the last thing the country needs in a time of economic challenge.

The four corners of deceit: government, academia, science and media. Those institutions are now corrupt and exist by virtue of deceit. That's how they promulgate themselves; it is how they prosper. It is tempting to laugh off this and other rhetoric broadcast by Rush Limbaugh, a conservative US radio host, but Limbaugh and similar voices are no laughing matter.

There is a growing anti-science streak on the American right that could have tangible societal and political impacts on many fronts — including regulation of environmental and other issues and stem-cell research. Take the surprise ousting last week of Lisa Murkowski, the incumbent Republican senator for Alaska, by political unknown Joe Miller in the Republican primary for the 2 November midterm congressional elections. Miller, who is backed by the conservative 'Tea Party' movement, called his opponent's acknowledgement of the reality of global warming "exhibit A" for why she needs to go.

The right-wing populism that is flourishing in the current climate of economic insecurity echoes many traditional conservative themes, such as opposition to taxes, regulation and immigration. But the Tea Party and its cheerleaders, who include Limbaugh, Fox News television host Glenn Beck and Sarah Palin (who famously decried fruitless research as a waste of public money), are also tapping an age-old US political impulse — a suspicion of elites and expertise.

Denialism over global warming has become a scientific cause célèbre within the movement. Limbaugh, for instance, who has told his listeners that "science has become a home for displaced socialists and communists", has called climate-change science "the biggest scam in the history of the world". The Tea Party's leanings encompass religious opposition to Darwinian evolution and to stem-cell

and embryo research — which Beck has equated with eugenics. The movement is also averse to science-based regulation, which it sees as an excuse for intrusive government. Under the administration of George W. Bush, science in policy had already taken knocks from both neglect and ideology. Yet President Barack Obama's promise to "restore science to its rightful place" seems to have linked science to liberal politics, making it even more of a target of the right.

US citizens face economic problems that are all too real, and the country's future crucially depends on education, science and technology as it faces increasing competition from China and other emerging science powers. Last month's recall of hundreds of millions of US eggs because of the risk of salmonella poisoning, and the Deepwater Horizon oil spill, are timely reminders of why the US government needs to serve the people better by developing and enforcing improved science-based regulations. Yet the public often buys into anti-science, anti-regulation agendas that are orchestrated by business interests and their sponsored think tanks and front groups.

In the current poisoned political atmosphere, the defenders of science have few easy remedies. Reassuringly, polls continue to show that the overwhelming majority of the US public sees science as a force for good, and the anti-science rumblings may be ephemeral. As educators, scientists should redouble their efforts to promote rationalism, scholarship and critical thought among the young, and engage with both the media and politicians to help illuminate the pressing science-based issues of our time.

"The country's future crucially depends on education, science and technology."

A destabilizing

Public allegations threaten the misconduct inquiries.

Investigations into charges of scientific misconduct are often fraught with emotion for all concerned. Emotions run high. As a consequence, it is crucial that all those involved in the process should act directly and indirectly, behave with dignity and respect. But events around such an investigation can be troubling and damaging to all concerned within months. An unknown agitator using the pseudonym 'Berns' is engaged in an e-mail and Internet campaign to discredit the work of medical researchers whom he accuses of misconduct. Berns's libellous messages are targeted at immunologist Silvia Bulfone-Paus, who holds joint positions at the University of

many. Disturbing a formal investigation, organized by the German government and begun in July, into the work of Berns, who is a senior research fellow at the Max Planck Institute for Medical Research in Cologne, Germany, and a senior research fellow at the University of Cologne, Germany, is a serious matter. Berns's actions could undermine the integrity of the investigation and the credibility of the scientific community. Berns's actions are a clear violation of the code of conduct for researchers and could lead to severe consequences. Berns's actions are a clear violation of the code of conduct for researchers and could lead to severe consequences. Berns's actions are a clear violation of the code of conduct for researchers and could lead to severe consequences.
