# 2015 Taulbee Survey <br> Continued Booming Undergraduate CS Enrollment; Doctoral Degree Production Dips Slightly 

By Stuart Zweben and Betsy Bizot

This article and the accompanying figures and tables present the results from the 45th annual CRA Taulbee Survey'. The survey, conducted annually by the Computing Research Association, documents trends in student enrollment, degree production, employment of graduates, and faculty salaries in academic units in the United States and Canada that grant the Ph.D. in computer science (CS), computer engineering (CE) or information (II). Most of these academic units are departments, but some are colleges or schools of information or computing. In this report, we will use the term "department" to refer to the unit offering the program. This year's survey also includes the so-called "department profiles" data about space, research funding sources, and teaching loads; these data are only requested every three years.

CRA gathers survey data during the fall. Responses received by February 5, 2016 are included in the analysis. The period covered by the data varies from table to table. Degree production and enrollment (Ph.D., Master's, and Bachelor's) refer to the previous academic year (2014-15). Data for new students in all categories refer to the current academic year (2015-16). Projected student production and information on faculty salaries are also for the current academic year; salaries are those effective January 1, 2016.

We surveyed a total of 266 Ph.D.-granting departments; we received responses from 178 for a response rate of 67 percent. This is similar to last year's 68 percent. The response rates from CE and Canadian departments continue to be rather low, and this year the CE response rate was even lower than usual. U.S. CS, U.S. I, and Canadian response rates were similar to last year. Figure 1 shows the history of response rates to the survey. Response rates are inexact because some departments provide only partial data, and some institutions provide a single joint response for multiple departments. Thus, in some tables the number of departments shown as reporting will not equal the overall
total number of respondents shown in Figure I for that category of department.

To account for the changes in response rate, we will comment not only on aggregate totals but also on averages per department reporting or data from those departments that responded to both this year's and last year's surveys. This is a more accurate indication of the one-year changes affecting the data.

Departments that responded to the survey were sent preliminary results about faculty salaries in December 2015; these results included additional distributional information not contained in this report. The CRA Board views this as a benefit of participating in the survey.

Degree, enrollment and faculty salary data for the U.S CS departments are stratified according to a) whether the institution is public or private, and b) the tenure-track faculty size of the reporting department. The faculty size strata deliberately overlap, so that data from most departments affect multiple strata. This may be especially useful to departments near the boundary of one stratum. Salary data also is stratified according to the population of the locale in which the institution is located. ${ }^{3}$ These stratifications allow our readers to see multiple views of important data, and hopefully gain new insights from them. In addition to tabular presentations of data, we will use "box and whisker" diagrams to show medians, quartiles, and the range between the 10th and 90th percentile data points.

We thank all respondents to this year's questionnaire. Departments that participated are listed at the end of this article. CRA member respondents again will be given the opportunity to obtain certain survey information for a selfselected peer group. Instructions for doing this will be emailed to all such departments.

Figure 1. Number of Respondents to the Taulbee Survey

| Year | US CS Depts. | US CE Depts. | Canadian | US Information | Total |

## Doctoral Degree Production, Enrollments and Employment

## (Tables DI-DIO; Figures DI-D6)

Last year's respondents reported production of 1,940 doctoral degrees. This year's respondents produced 1,780 doctoral degrees, a decline of 8.2 percent. However, on a per-department basis, the decline is only 4.9 percent. An examination of the data by area of computing shows that the aggregate decline in degrees produced does not come from U.S. CS departments, and that overall, U.S. private CS departments actually increased their productivity on a per-department basis. Each of the other groups (CE, I and Canadian) show declines, but these numbers are more strongly influenced by the specific departments responding in a given year, since we receive data from only a small number of these departments.

Among all departments reporting both this year and last year, the number of total doctoral degrees declined by 3.5 percent,
but among U.S. CS departments reporting both years, there was essentially no change (actually an increase of 0.3 percent)

Women comprised 18.3 percent of CS doctoral graduates and 20.2 percent of all doctoral computing graduates, both values being slightly higher than those reported last year. The percentage of CS doctoral degrees that went to Non-resident Aliens also was slightly higher than last year, at 60.7 percent compared with 60.1 percent, while the percentage that went to resident Asians dropped to 6.4 percent from 8.1 percent. CE had an even higher percentage of Non-resident Aliens than did CS, and was less gender diverse. Among I doctoral degrees, 45.8 percent went to Non-resident Aliens and 33.8 percent to Whites; for Non-resident Aliens this is an increase compared with last year's report; for Whites it is a slight decrease.

The percentage of doctoral graduates who were American Indian or Alaska Native, Black or African American, Native Hawaiian/Pacific Islander, Hispanic, or Multiracial Non-Hispanic rose from 2.6 percent to 4.0 percent in CS, and was 4.5 percent in aggregate across CS, CE and I (vs 3.4 percent in 2013-14). As
they did last year, Non-resident Aliens and Resident Asians comprised a higher percentage of the CS female doctoral graduates than they did CS male graduates, while Whites comprised a lower percentage of the female graduates as compared with male graduates (Table D9).

Among currently enrolled CS doctoral students whose ethnicity is known, we see the same direction of difference among

Non-resident Aliens and Whites; Non-resident Aliens comprise a higher percent of the enrolled women than they do the enrolled men, and Whites comprise a lower percentage of enrolled women. This is similar to the observations last year. Resident Asians comprise a similar percentage of enrolled Asian men and Asian women (Table DIO).

Among those pursuing I degrees, 62 percent of the men and 55 percent of the women are Non-resident Aliens or Resident Asians. This is a higher percentage for both men and women than last year, but is a similar-sized difference between men and women. Also similar to last year, there is no appreciable difference in the percentage of men vs the percentage of women among Whites pursuing I degrees.

At U.S. CS departments, the average number of students per department who passed qualifier exams rose to 14.3 in 2014-15, from 13.9 in 2013-14. The increase was due to departments
in public institutions; there was a decrease in U.S. private institutions. The average number per department who passed thesis candidacy exams in 2014-15 (most, but not all, departments have such exams) increased slightly from 2013-14 at both public and private U.S. CS departments (Table DI).

Once again, the number of new Ph.D. students per department reporting increased slightly this year compared with the total from last year's reporting departments (Tables I and D5). This reflects increases in CS departments and decreases in CE, I, and Canadian departments. Among all departments that

reported both years, the number of new Ph.D. students was unchanged. If only U.S. CS departments that reported both years are considered, there was an increase of 2.0 percent.

The proportion of new doctoral students from outside North America continues to increase. This year's proportion is 65.7 percent while last year's was 62.6 percent. There were increases in all categories of departments with the exception of U.S. CS private (Table D5a).

Among programs that reported both years, total doctoral enrollment increased l.l percent. If only U.S. computer science departments are considered, the increase was only 0.2 percent (Table 1). Total doctoral enrollment by gender is in about the same overall proportion reported last year (Table D7), with a slight increase in diversity in CS and a decrease
and industry, those taking employment outside of North America, and those going to academia who took positions in departments other than Ph.D.-granting CS/CE departments. Table D4 shows a more detailed breakdown of the employment data for new Ph.D.s. The percentage of new Ph.D.s who took positions in North American industry was 57.3 percent, just below last year's historic record of 57.5 percent. Among those doctoral graduates who went to North American industry as other than a postdoc and for whom the type of industry position was known, about 59 percent took research positions (Table D4a). This is up from the 56 percent reported last year. This year, definitive data was provided for 90 percent of the graduates who went to industry, an improvement over last year's 87 percent. in I departments. The fraction of doctoral students who are not either Non-resident Aliens, Asian or White remains below 5 percent (Table D8).

Figure D5 shows a graphical view of the Ph.D. pipeline for computer science programs. The data in this graph are normalized by the number of departments reporting. The graph offsets the qualifier data by two years from the data for new students, and offsets the graduation data by five years from the data for new students. These data have been useful in estimating the timing of changes in production rates. The graph suggests that doctoral production will remain fairly steady during the next few years, though the departments are forecasting an increase in production during 2015-16 (Table DI).

Figure D6 shows the employment trend of new Ph.D.s in academia

CRA
Computing Research Association

The percentage of 2014-15 graduates who took North American academic jobs rose this year to 29.0 from last year's all-time low of 27.3. The percentage of graduates taking tenure-track positions in North American doctoral granting computing departments rose to 10.0 in 2014-15, from 7.6 for 2013-14 graduates. The percentage taking positions in North American non-Ph.D.-granting computing departments rose from 1.9 percent to 2.3 percent, while the percentage taking North American academic postdoctoral positions dropped from 11.6 percent to 9.7 percent.

Among those whose employment is known, the proportion of Ph.D. graduates who were reported taking positions outside of North America fell from 9.4 percent to 7.8 percent. Only 24 percent of those employed outside of North America went to industry compared to 37 percent reported last year. About 17 percent went to tenure-track academic positions, down from 26 percent last year, while approximately 20 percent went to academic postdoctoral positions, similar to last year. Teaching and research positions in academic departments, and employment in government positions, were higher this year
among those who went outside North America. Of the doctoral graduates who went to non-North American industry positions, the positions were in research by almost a two-to-one margin over those that were not research; that ratio was three-to-one each of the past two years. Definitive data was provided for 96 percent of these graduates.

Employment in industry postdoctoral positions is included in the overall industry numbers. When academic and industry postdocs are combined, the result is that 12.6 percent of 201415 doctoral graduates took some type of postdoctoral position, down from 15.6 percent last year and 18.1 percent the year before last. Approximately 11 percent of these were industry postdocs; last year 14 percent of postdocs were industry postdocs.

The unemployment rate for new Ph.D.s again this year was below one percent. In 2014-15, 21.0 percent of new Ph.D.s' employment status was unknown; in 2013-14 it was 19.7 percent. It is possible that the lack of information about the employment of more than one in five graduates skews the real overall percentages for certain employment categories.

Table D4 also indicates the areas of specialty of new Ph.D.s. Artificial intelligence, networks, software engineering and databases continue to be the most popular areas of
specialization for doctoral graduates. But this year the order is different. Software engineering moved from third to first, followed by artificial intelligence, databases and networks.

## Master's and Bachelor's Degree Production and Enrollments

This section reports data about enrollment and degree production for Master's and Bachelor's programs in the doctoral-granting departments. Although the absolute number of degrees and enrolled students reported herein only reflect departments that offer the doctoral degree, the trends
observed in the master's and bachelor's data from these departments tend to strongly reflect trends in the larger population of programs that offer such degrees.

## Master’s (Tables MI-M8; Figures MI-M2)

On a per-department basis, CS master's degree production in U.S. CS departments rose nearly $25 \%$ in 2014-15; this follows

Table M1. Master's Degrees Awarded by Department Type

two consecutive years of relatively flat production. Both public and private departments reported large increases.

Overall production of master's degrees in the information area declined in 2014-15, following two consecutive years of growth. U.S. public CS departments showed an increased production of information Master's degrees, while U.S. private CS departments reported decreases. U.S. I departments also reported decreased production of information master's degrees, the opposite of what took place last year (Table MI). The proportion of female graduates among master's degree recipients rose in CS from 22.0 percent to 24.9 percent, and this resulted in a slight rise in the overall percentage of master's degrees to women, from 28.7 to 29.3 (Table M2). In the information area, the percentage of the master's recipients that were Non-resident Aliens increased in 2014-15 to 33.3 percent as compared with 28.1 percent 2013-14. In CS, 68.1 percent of the master's degrees went to Non-resident

Aliens, similar to the 67.8 percent in 2013-14. In both CS and I, the fraction of master's degrees going to Whites declined (Table M3).

Again this year, Non-resident Aliens comprised a much larger proportion of female CS degree recipients than male CS degree recipients, while Whites comprised a larger percentage of male CS degree recipients than female CS degree recipients (Table M7). With somewhat differing percentages, the same observations held for CE master's graduates. In the I area, Non-resident Aliens again comprised a larger percentage of male master's graduates than female master's graduates, and Whites comprised a smaller fraction of male master's graduates than female master's graduates. The current enrollment breakdown by gender and ethnicity (Table M8) suggests that these observations will continue to be reflected in master's recipients in the near future.

[^0]There were increases in the average number of new master's students enrolled in U.S. CS departments. U.S. CS departments at both public and private institutions experienced these increases (Table M5). For departments at public institutions, this represents the fourth straight year of increases. This suggests further increased production of master's degrees in the next couple of years.

The fraction of new master's students in U.S. CS departments that is reported to be from outside North America declined slightly, from 64.5 percent in 2014-15 to 63.3 percent in 2015-16 (Table M5). At U.S. information departments, the fraction of new master's students from outside North America decreased from 43.5 percent to 32.4 percent, following two consecutive years of increase.

Figure M1. Master's Degrees Granted by Tenure-Track Size CRA Taulbee Survey 2015

Figure M2. Master's Enrollment Normalized by Tenure-Track Size CRA Taulbee Survey 2015

## Bachelor's (Tables 1, BI-B8; Figures BI-B4)

When comparing all departments reporting this year to all departments reporting last year, there was an increase in bachelor's degree production of 26.9 percent overall, and 21.6 percent per department. When considering only those departments that reported both years, the increase was
22.2 percent. Among U.S. computer science departments, the increases were 21.8 percent overall and 14.7 percent per department when comparing totals for all reporting departments. The increase was 17.7 percent for those U.S. CS departments that reported both years (Table I).

| Grand Total | 149 | 18,134 |  | 2,479 |  | 3,138 |  | 23,751 |  |  |

This marks the second consecutive year of double-digit percentage increases in bachelor's degree production. It is a natural outgrowth of the booming bachelor's enrollments reported for the past several years.

For the eighth straight year, there was an increase in the number of new undergraduate computing majors. This year's respondents reported 17.8 percent more new majors (16.2 percent per department) than did last year's respondents. The increase is 14.3 percent when considering only those departments reporting both this year and last year. Among U.S. computer science departments, the increase was 24.1 percent overall ( 16.0 percent per department), and 17.1 percent among departments reporting
both this year and last year. Figure B2 illustrates the trend in the total number of newly declared CS/CE undergraduate majors as reported in the Taulbee Survey. Over the past four years, this number has almost doubled, and now exceeds the levels reported during the dot-com boom period.

Total undergraduate enrollment in computing majors among U.S. CS departments (i.e., the sum of the number of majors in CS, CE and I at these departments) increased 22.5 percent (13.6 percent per department) when all respondents are compared, and increased 12.6 percent among departments reporting both this year and last year. Aggregate total enrollment (which combines CS departments, CE departments, I departments and Canadian departments) once

CRA
Computing Research Association
again increased in all three computing areas (CS, CE, and I), although the increase in CE was only just over 2 percent (Table B6). New student enrollment also increased once again in all three areas (Table B5).

The proportion of women among bachelor's graduates in CS rose from 14.1 percent in 2013-14 to 15.7 percent in 2014-15. In CE, the percentage of female bachelor's graduates was 11.6, the same as it was two years ago (it was 11.2 percent last year). There also was an increase in the percentage of I degrees going to women from 20.3 percent to 21.7 percent (Table B2). The fraction of CS bachelor's degrees awarded to Whites declined from 57.7 percent in 2013-14 to 55.0 percent in 2014-15, and the percentage awarded to Asians rose from 21.1 percent to 22.8 percent. Changes in other ethnicity categories
were less than one percent in CS. In aggregate across the three degree areas, 54.2 percent of the graduates were White, 21.8 percent Asian, 8.5 percent Non-resident Aliens, and 15.5 percent all other ethnicity categories combined. However, in I programs, the other ethnicity categories accounted for over 23 percent of the graduates (Table B3).

In all three computing areas (CS, CE and I), Resident Asians and Non-resident Aliens comprise a larger fraction of female degree recipients than male recipients, while Whites comprise a larger fraction of male degree recipients than female recipients (Table B7). Table B8 indicates that the same comparisons hold true for total bachelor's enrollment. We observed these same results in last year's report.

## Faculty Demographics (Tables Fl-F9) ${ }^{4}$

Table Fl shows the current and anticipated sizes, in FTE, for tenure-track, teaching and research faculty, and postdocs. The total tenure-track faculty count in U.S. CS departments $(3,880)$ represents about a 9 percent increase over last year. The average tenure-track faculty size per U.S. CS department went from 27.4 to 28.1 during this period. In these departments, the average number of teaching faculty increased from 5.7 to 6.9 and the average number of postdocs increased from 6.0 to 6.5, while the average number of research faculty decreased from 6.1 to 5.4. Canadian, CE and I departments have much more volatile data due to the small number of departments reporting in each of those categories.

As we have mentioned in previous Taulbee reports, Canadian universities, on average, have several more tenure-track faculty members per department than do U.S. universities, while on average U.S. I departments and U.S. CE departments are somewhat smaller than U.S. CS departments. The
observations about U.S. CE and I departments may reflect the fact that we ask departments to report only computing-related faculty, so departments with Library Science or EE programs may report only part of their faculty.

Among U.S. CS departments, those at private universities tend to have more teaching faculty, research faculty and postdocs than do those at public universities on average. This observation also was made last year. However, this year the average tenure-track faculty size at public universities was slightly larger than that at private universities; this is a change from previous years.

Table F2 summarizes faculty hiring this past year. The success rate for hiring tenure-track faculty at U.S. CS departments fell from 80.2 percent in 2013-14 to 70.8 percent in 2014-15. Even with this decline the 2014-15 rate still was higher than that of two years ago. The success rate was almost identical at public and private departments. Again this year, Canadian departments had lower success rates on average than did U.S.

CS, U.S. CE and U.S. I departments. In aggregate, the tenuretrack hiring success rate fell from 78.8 percent to 70.6 percent. Among those hired into all categories of academic positions (tenure-track, teaching faculty, research faculty and postdoc) in 2014-15, 21.6 percent were women, a slight decrease from the 22.1 percent in 2013-14 (Table F3). Considering only tenuretrack positions, the proportion of women hired declined from 21.8 percent in 2013-14 to 20.3 percent in 2014-15. Only among research faculty positions was there an increase in the percentage of positions going to women as compared with those reported last year. The percentage of new female tenure-track and overall faculty hires is similar to the percentage of new female Ph.D.s produced this past year.

Among new tenure-track faculty, the fraction who are white declined from 49.5 percent to 44.8 percent, while the fraction who are Non-resident Alien or Asian new hires rose from 41.8 percent to 43.5 percent. Once again, whites dominated the newly hired teaching faculty, with Asians and Non-resident Aliens accounting for most of the remainder. Among research faculty, whites comprised 42.3 percent of new hires, while Non-resident Aliens or resident Asians in aggregate comprised 53.8 percent of new hires. Among postdoc new hires, whites comprised 19.8 percent, about half of what it was last year, with Non-resident Aliens and resident Asians collectively comprising 75.4 percent compared with just over 50 percent last year (Table F4).

There were slightly fewer faculty losses reported this year as compared with last year (Table F5). Retirements were the biggest reason for faculty loss, and were up substantially this year as compared with last year. Movement from one academic position to another was the next largest cause of faculty attrition.

The proportion of women at the full professor rank rose from 13.3 percent last year to 14.3 percent this year, while the proportion at the associate professor level rose from 20.5 to 22.1 percent. The proportion at the assistant professor level, however, fell from 24.6 to 23.7 percent (Table F6). There also were decreases in the proportion of women among teaching faculty and postdocs, while there was an increase in the proportion of women among research faculty. Whites, Asians and Non-resident Aliens account for more than 85 percent of each category of faculty members (Table F7).

Ninety-five percent of departments provided gender by ethnicity breakdowns for their current faculty members. (Tables F8 and F9). Whites again comprised a greater percentage of female full professors than they do male full professors, while the reverse is true at the associate professor level. Asians comprise a greater percentage of male full professors than they do female full professors.

For next year, U.S. CS departments forecast a 7.6 percent growth in tenure-track faculty, and an 11.7 percent growth in teaching faculty. They also forecast a 12.0 percent growth in postdocs.

## Research Expenditures (Table R1; Figures RI-R2)

Table Rl shows the department's total expenditure (including indirect costs or "overhead" as stated on project budgets) from external sources of support. Figures R1 and R2 show the per capita expenditure, where capitation is computed two ways. The first (Figure RI) is relative to the number of tenuretrack faculty members. The second (Figure R2) is relative to researchers and postdocs as well as tenure-track faculty. Canadian levels are shown in Canadian dollars.

Overall median research expenditures for 2014-15 at U.S. CS public departments fell 10.7 percent in comparison with 2013-14. At U.S. CS departments in private institutions, median expenditures rose 37.6 percent. The median research expenditure at U.S. CS departments in private institutions is nearly twice that of public institutions. Median expenditures also fell at U.S. I departments and Canadian departments in comparison with 2013-14. It should be noted that for each department type, fewer departments provided research

Table R1. Total Expenditure from External Sources for Computing Research

| Department <br> Type | $\#$ <br> Depts | Percentile of Department Averages |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 10th | 25th | 50th | 75th | 90th |
| US CS Public | 72 | $\$ 608,907$ | $\$ 1,758,770$ | $\$ 3,528,438$ | $\$ 8,278,021$ | $\$ 15,596,967$ |
| US CS Private | 21 | $\$ 1,506,373$ | $\$ 2,936,144$ | $\$ 6,883,862$ | $\$ 13,380,854$ | $\$ 20,150,000$ |
| US CE | 3 |  |  | $\$ 2,330,244$ |  |  |
| US Information | 12 | $\$ 1,320,092$ | $\$ 2,076,549$ | $\$ 2,982,247$ | $\$ 4,621,781$ | $\$ 4,796,780$ |
| Canadian | 8 |  | $\$ 1,898,335$ | $\$ 3,289,450$ | $\$ 5,621,809$ |  |

Figure R1. Research Expenditures Normalized by Tenure-Track Size CRA Taulbee Survey 2015

expenditure data this year than did so last year. This was especially true for U.S. CS departments. Furthermore, the I and Canadian departments are based on much smaller samples, which makes these comparisons subject to more volatility. There was an insufficient number of CE departments reporting to be able to report any meaningful comparative results.

The U.S. CS data for public institutions indicate that the larger the department, the more external funding per
capita is received by the department. The effect of size of the department on research expenditures per capita at private institutions is hard to assess, because very few small departments at these institutions provided research expenditure data this year

Figure R2. Research Expenditures Normalized by Tenure-Track + Research Faculty + Postdoctorates CRA Taulbee Survey 2015

## Graduate Student Support (Tables GI-G2; Figures GI-G3)

Table Gl shows the number of graduate students supported as full-time students as of fall 2015, further categorized as
teaching assistants (TAs), research assistants (RAs), and fullsupport fellows. The table also shows the split between those on institutional vs. external funds. The average number of TAs on institutional funds in U.S. CS departments increased 31.8 percent this year. Public universities reported a 17.9 percent

increase, while the average at private universities more than doubled. In last year's report, private universities reported over a 14.2 percent decrease. It is possible that there were some inconsistencies between years in departmental reporting. The average number of TAs at I departments rose 15.2 percent and the average at Canadian departments rose 64.9 percent. The small number of I and Canadian departments make these comparative averages subject to volatility. However, it seems safe to say that all types of departments increased their average number of TAs this year. This is consistent with the undergraduate enrollment increases reported earlier.

Following a year of significant decline at both public and private universities in the average number of RAs on institutional funding, this average more than doubled this year at U.S. public universities, and nearly tripled at U.S. private universities. The number of RAs on external funding decreased by 14.6 percent in U.S. CS departments at public universities, but increased by 39.7 percent in departments at private universities. For the second year in a row, we see both public and private institutions experiencing just the reverse of what was experienced in the previous year's report. The average number of full-support fellows on both internal and external funds declined in U.S. CS departments at both public and private universities.

Table G2 shows the distribution of stipends for TAs, RAs, and full-support fellows. U.S. CS data are further broken down
in this table by public and private institution. Figures GI-G3 further break down the U.S. CS data by size of department and by geographic location of the university.

The median TA salaries at U.S. CS departments increased 1.2 percent at public universities and increased 2.6 percent at private universities. Median salaries of RAs were essentially unchanged at public universities but rose 5.9 percent at private universities. For full support fellows, median salaries rose 4.1 percent at U.S. public universities but declined 13.9 percent at U.S. private universities. Last year, we reported a large increase in the median salary of full support fellows at private universities, so there may be an error in the data provided to us in one of the years. Through further analysis, we also observed that those departments from private institutions that reported in this year's survey but not last year's typically had lower than average stipends. Larger departments at U.S. public universities tend to offer higher stipends to both TAs and RAs than do smaller departments, and private universities tend to offer higher stipends to all categories of grad students than do public universities. As was the case last year, departments located in larger population centers also tend to pay higher stipends to TAs; the effect of locale on RA stipends was less clear this year for both publics and privates, and the data for full-support fellows exhibits no clear trend relative to locale at public universities.

CRA Taulbee Survey 2015

## Faculty Salaries (Tables Sl-S21; Figures Sl-S9)

Each department was asked to report individual (but anonymous) faculty salaries if possible; otherwise, the department was requested to provide the mean salary for each rank (full, associate, and assistant professors and non-tenure-track teaching faculty, research faculty, and post-doctorates) and the number of persons at each rank. The salaries are those in effect on January 1,2016 . For U.S. departments, nine-month salaries are reported in U.S. dollars.

For Canadian departments, twelve-month salaries are reported in Canadian dollars. Respondents were asked to include salary supplements such as salary monies from endowed positions. U.S. CS data are reported in Tables SI-S16 and in the box and whiskers diagrams. Data for CE, I, Canadian and new Ph.D.s are reported in Tables S17-S20. The tables and diagrams contain distributional data (first decile, quartiles, and ninth decile) computed from the department averages only. Thus, for example, a table row labeled " 50 " or the median line in a

diagram is the median of the averages for the departments that reported within the stratum (the number of such departments reporting is shown in the "depts" row). It therefore is not a true median of all of the salaries.

We also report salary data for senior faculty based on time in rank, for more meaningful comparison of individual or departmental faculty salaries with national averages. We report
associate professor salaries for time in rank of 7 years or less, and of more than 7 years. For full professors, we report time in rank of 7 years or less, 8 to 15 years, and more than 15 years.

Those departments reporting salary data were provided a summary report in December 2015. Those departments that provided individual salaries were additionally provided more comprehensive distributional information based on these

individual salaries. This year, 75 percent of those reporting salary data provided salaries at the individual level.

The remainder of this section updates the basic report provided in December to all departments that provided salary data. It reflects salary data received since the deadline for that report.

Salaries at private institutions tend to be higher than those at public institutions for all faculty types (Tables S2 and S3). This pattern is consistent with observations in previous years.

Viewed relative to faculty size, salaries at each rank tend to be higher for larger departments at both public (Tables S4-S8) and private (Tables S9-S11) institutions. At public institutions, this

| Research faculty | $-3.6 \%$ | $-21.7 \%$ | $38.6 \%$ | $-2.9 \%$ |
| Post doctorates | $2.4 \%$ |  | $-5.7 \%$ | $-5.8 \%$ |

also is consistent with the pattern in previous years. At private institutions last year, senior faculty salaries at larger departments did not tend to be higher than those at smaller departments.

Viewed relative to type of locale, public institution salaries appear to be generally lower in smaller locales for assistant professors and early stage associate professors (Tables S12-S14), while private institution salaries exhibit no consistent pattern relative to type of locale (Tables S15-S16). These observations coincide with those in previous years.

When analyzing the magnitude of faculty salary changes from one year to the next, we use only those departments that reported both years; otherwise, the departments that reported during only one year can skew the comparison. Because some departments that reported both years provided only aggregate salaries for their full and associate professors during one year and in the other year reported them by years in rank, we only report salary changes for all full professors and for all associate professors in the year-to-year comparison. Table S21 shows, by type of faculty and type of department, the change in the median of the average salaries from departments that reported both years (the number of departments being compared is indicated in the first row of each column). Using the cell showing full professors at U.S. CS departments as an
example, the table indicates that the median of the 117 average salaries for full professors was 4.2 percent higher in 2015 than was the median of the average full professor salaries in 2014 from these same 117 departments.

When interpreting these changes, it is important to remember the effect that promotions have on the departmental data from one year to the next, since individual faculty members move from one rank to another. Thus, a department with a small number of faculty members in a particular rank can have its average salary in that rank change appreciably (in either direction) by a single promotion to or from that rank. Departures via resignation or retirement also impact these figures, particularly in the non-tenure-track categories. Because of the small number of Canadian and Computer Engineering departments reporting, the values in those columns are considerably more volatile.

For new Ph.D.s in tenure-track positions at U.S. computer science, computer engineering, and l-school departments (Table S20) the median of the averages was \$98,500, an increase of 3.5 percent vs. last year. This year there is a sufficient number of Canadian institutions to report the median of the averages, but in 2014 none were reported, so year-toyear comparisons cannot be made.

## Department Profiles

Every three years, the Taulbee Survey collects data about elements of departmental activities that are not expected to change much from year to year. Included are data about teaching loads, sources of external funding, methods of recruiting graduate students, department support staff, and space. The most recent data about these activities were reported in the 2012 Taulbee Survey. The results of that survey are available on the CRA web site at http://cra.org/wp-content/ uploads/2015/01/2012_taulbee_survey.pdf.

## Teaching loads (Tables Profl-Prof4)

Across all departments, the median teaching load in semester courses per year is 3.0 , which has not changed over a long period of time. This median holds true in all departments except for U.S. CS private institutions where the median teaching load is 2.0, unchanged from last reporting. Three years ago, the medians at U.S. CE and U.S. I departments were 4.0 and 3.5 , respectively. Note that the CE and I groups are small and thus more sensitive to the individual institutions reporting in a given year. (Table Profl).

Table Prof2 shows whether or not it is possible to increase or decrease individual teaching loads from the standards, and Tables Prof 3 and Prof 4 indicate why such adjustments might be allowed. As has been the case in previous years, nearly every department allows reductions from the standard load, with little difference across department types. However, the reasons for reductions do vary across department types, with U.S. CS publics generally allowing more possible factors to reduce teaching load than do U.S. CS privates. Also as in previous years, about $2 / 3$ of all departments allow increases, with a greater percentage of publics and Canadian departments allowing increases as compared with privates and U.S. I departments. A smaller percentage of departments (7l percent) allow increases for shifting primary responsibilities to teaching than did previously ( 76 percent three years ago and 81 percent six years ago), while a larger percent (29 percent) allow increases for other reasons than did previously ( 24 percent three years ago and 19 percent six years ago).

Table Prof1. Official Teaching Load of Tenured and Tenure-Track Faculty

|  | Official Teaching Load* |  |  |  |  | Academic Calendar |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Sources of External Funding (Tables R2, R3)

Table R2 shows the distribution of sources of external research funding, and its historical values over the five three-year intervals during which we have collected such data. There is little difference in the distribution in 2015 compared with 2012.
The average research support per department increased four
percent from 2012 to 2015, though this can be highly dependent on the particular departments responding; there are fewer departments that provided distributional information this year than did so in 2012. NSF continues to be the dominant funder of external research, followed by non-DARPA defense funding and industry funding.

## Other Graduate Student Data (Tables Prof5-Prof7)

Table Prof5 illustrates the factors that are most likely to affect graduate student stipends. Advancement to the next stage of study and the source of funding are the most likely factors. Stipends are considerably less likely than three years ago to be affected by years of service ( 17 percent vs 25 percent). Less drastic drop-offs in likelihood were present in advancement to the next stage of the program (48 percent vs 52 percent) and GPA (11 percent vs 13 percent).

Tables Prof6 and Prof7 focus on incentives for recruiting graduate students. Compared with three years ago, a greater percentage of departments have one-time signing bonuses ( 12 percent vs 6 percent) while a smaller percentage employ stipend enhancements ( 17 percent vs 25 percent), guaranteed multi-year support ( 51 percent vs 58 percent), and paid visits to campus ( 37 percent vs 42 percent).

Table Prof5. Factors Affecting the Amount of a Graduate Student's Stipend

## Space (Tables Prof8-Prof16)

With the enormous increases in undergraduate enrollments since the last survey of department profiles, it is of particular interest to see if space has grown during this time. Compared with three years ago, median overall department space has grown by about 6 percent, the same percentage amount that it grew in the previous three years. Conference and seminar space grew the most, by 31 percent, while office and laboratory space grew by 11-16 percent (Table Prof8).

Office space and research lab space grew more at U.S. CS public departments than at U.S. CS private departments, while conference and research lab space grew more at privates. Instructional lab space grew between 22 (privates) and 26 percent (publics) at U.S. CS departments (Tables Prof9 and Profio).

One-quarter of U.S. CS public departments reported definite plans to increase space, and one-third of U.S. CS private departments did likewise (Table Profl4). Both of these fractions are higher than three years ago, and particularly so for public departments, where only 9 percent had definite plans to increase space three years ago.

Table Prof8. Department Space, net square feet, 133 US institutions

| Percentiles | Total Space | Faculty, Staff, and <br> Student Offices | Conference and <br> Seminar Rooms | Research Labs | Instructional Labs |

## Departmental Support Staff (Tables Prof17-Prof21)

Tables Profl7-Prof22 show the distribution of staffing levels based on department type. Compared with three years ago, the median number of administrative and computer support staff rose from 5 to 6 , and from 2 to 3 , respectively. As was the case three years ago, median levels of administrative staff in U.S. CS
departments are higher at private institutions than at public institutions, while median levels of computer support staff are similar at public and private institutions. Higher median levels are notable in U.S. I programs for both administrative and computer support staff. This likely is because these units tend to be schools rather than departments.

Table Prof17. Full Time Staff by Type of Support - US CS Public

## Concluding Observations

The Taulbee Survey clearly documents the continued undergraduate enrollment boom being seen in U.S. doctoralgranting computer science programs. It also shows that departments are adding teaching faculty, TAs and, to a lesser extent, tenure-track faculty to their rolls. CRA is studying this enrollment phenomenon in more depth. A special task force led by Tracy Camp will report later this year on the results of a more targeted study of the CS enrollment boom in both doctoral-granting and non-doctoral-granting departments. Those results should be of interest to all in the computing community.

## Participating Departments

US CS Public (107): Arizona State, Auburn, Clemson, College of William \& Mary, Colorado School of Mines, Colorado State, Florida International, George Mason, Georgia Tech, Georgia State, Indiana, Iowa State, Kansas State, Kent State, Michigan State, Michigan Technological University, Mississippi State, Missouri Science \& Technology, Montana State, Naval Postgraduate School, New Jersey Institute of Technology, New Mexico State, North Carolina A\&T, North Carolina State, North Dakota State, Ohio State, Ohio, Oklahoma State, Old Dominion, Oregon State, Pennsylvania State, Portland State, Purdue, Rutgers, Southern Illinois, Stony Brook (SUNY), Texas A\&M, Texas Tech, University at Albany, University at Buffalo, Universities of: Alabama (Birmingham and Tuscaloosa), Arizona, Arkansas, Arkansas at Little Rock, California (Berkeley, Davis, Irvine, Riverside, San Diego, Santa Barbara, and Santa Cruz),

Central Florida, Colorado (Boulder), Connecticut , Delaware, Florida, Georgia , Hawaii, Houston, Illinois (Chicago and Urbana Champaign), Iowa, Kansas, Kentucky, Louisiana at Lafayette, Maryland (College Park and Baltimore County), Massachusetts (Amherst and Boston), Michigan, Minnesota, Mississippi, Missouri (Columbia), Nebraska (Omaha and Lincoln), Nevada (Las Vegas and Reno), New Hampshire, New Mexico, North Carolina (Chapel Hill and Charlotte), North Dakota, North Texas, Oklahoma, Oregon, Pittsburgh, Rhode Island, South Carolina, South Florida, Tennessee (Knoxville), Texas (Arlington, Austin, Dallas, and El Paso), Utah, Vermont, Virginia, Washington, Wisconsin (Madison and Milwaukee), and Wyoming, Virginia Tech, Washington State, Wayne State, Western Michigan, and Wright State.

US CS Private (40): Boston University, Brown, Carnegie Mellon, Case Western Reserve, Clarkson, Columbia, Cornell, Dartmouth, DePaul, Drexel, Duke, Emory, Georgetown, Harvard, Howard, Illinois Institute of Technology, Johns Hopkins, Lehigh, MIT, New York University, Northeastern, Northwestern, Nova Southeastern, Polytechnic, Princeton, Rensselaer, Rice, Rochester Institute of Technology, Stanford, Stevens Institute of Technology, Toyota Technological Institute at Chicago, Tufts, Universities of: Chicago, Pennsylvania, Rochester, Southern California, and Tulsa, Washington in St. Louis, Worcester Polytechnic Institute, and Yale.

US CE (8): Northeastern, North Carolina State, Universities of: California (Santa Cruz), Central Florida, Illinois (Urbana Champaign), New Mexico, and Southern California, and Virginia Tech.

US Information (14): Cornell, Drexel, Florida State, Indiana, Penn State, Syracuse, University at Albany (SUNY), Universities of: California (Berkeley), Illinois (Urbana Champaign), Maryland (Baltimore County), Michigan, North Carolina (Chapel Hill), Pittsburgh, and Washington.

Canadian (12): Concordia, McGill, Simon Fraser, Universities of: British Columbia, Calgary, Manitoba, New Brunswick, Toronto, Victoria, Waterloo, and Western Ontario, and York.
'The title of the survey honors the late Orrin E. Taulbee of the University of Pittsburgh, who conducted these surveys for the Computer Science Board until 1984, with retrospective annual data going back to 1970.
${ }^{2}$ Information (I) programs included here are Information Science, Information Systems, Information Technology, Informatics, and related disciplines with a strong computing component. Surveys were sent to CRA members, the CRA Deans group members, and participants in the iSchools Caucus (www.ischools.org) who met the criteria of granting Ph.D.s and being located in North America. Other I-programs who meet these criteria and would like to participate in the survey in future years are invited to contact survey@cra.org for inclusion.
${ }^{3}$ Classification of the population of an institution's locale is in accordance with the Carnegie Classification database. Large cities are those with population $>=250,000$. Mid-size cities have population between 100,000 and 250,000. Town/rural populations are less than 100,000.
${ }^{4}$ All faculty tables: The survey makes no distinction between faculty specializing in CS vs. CE programs. Every effort is made to minimize the inclusion of faculty in electrical engineering who are not computer engineers.

[^0]:    * \% of M and $\%$ of F columns are the percent of that gender who are of the specified ethnicity, of those whose ethnicity is known
