# 2014 Taulbee Survey 

## Relentless Growth in Undergraduate CS Enrollment; Doctoral Degree Production Remains Strong, But No New Record

By Stuart Zweben and Betsy Bizot

This article and the accompanying figures and tables present the results from the 44th annual CRA Taulbee Survey'. The survey, conducted annually by the Computing Research Association, documents trends in student enrollment, degree production, employment of graduates, and faculty salaries in academic units in the United States and Canada that grant the Ph.D. in computer science (CS), computer engineering (CE) or information (I) $)^{2}$. Most of these academic units are departments, but some are colleges or schools of information or computing. In this report, we will use the term "department" to refer to the unit offering the program.

CRA gathers survey data during the fall. Responses received by January 26, 2015 are included in the analysis. The period covered by the data varies from table to table. Degree
production and enrollment (Ph.D., Master's, and Bachelor's) refer to the previous academic year (2013-14). Data for new students in all categories refer to the current academic year (2014-
15). Projected student production and information on faculty salaries are also for the current academic year; salaries are those effective January l, 2015.

We surveyed a total of 268 Ph.D.-granting departments; 181 completed the online survey form, for a response rate of 68 percent. This is similar to last year's 67 percent. The response rate from the U.S. CS departments was 76 percent this year, similar to the 77 percent rate of last year. We had an improved response rate from I departments, to 68 percent from 50 percent last year. The response rates from CE and Canadian departments continue to be rather low. Figure 1 shows the

Figure 1. Number of Respondents to the Taulbee Survey

| Year | US CS Depts. | US CE Depts. | Canadian | US Information | Total |
| :---: | ---: | ---: | ---: | ---: | :---: |

history of response rates to the survey. Response rates are inexact because some departments provide only partial data, and some institutions provide a single joint response for multiple departments. Thus, in some tables the number of departments shown as reporting will not equal the overall total number of respondents shown in Figure 1 for that category of department.

To account for the changes in response rate, we will comment not only on aggregate totals but also on averages per department reporting or data from those departments that responded to both this year's and last year's surveys. This is a more accurate indication of the one-year changes affecting the data.

Departments that responded to the survey were sent preliminary results about faculty salaries in December 2014; these results included additional distributional information not contained in this report. The CRA Board views this as a benefit of participating in the survey.

Degree, enrollment and faculty salary data for the U.S CS departments are stratified according to a) whether the institution is public or private, and b) the tenure-track faculty size of the reporting department. The faculty size strata deliberately overlap, so that data from most departments affect multiple strata. This may be especially useful to departments near the boundary of one stratum. Salary data also is stratified according to the population of the locale in which the institution is located. ${ }^{3}$ These stratifications allow our readers to see multiple views of important data, and hopefully gain new insights from them. In addition to tabular presentations of data, we will use "box and whisker" diagrams
to show medians, quartiles, and the range between the 10th and 90th percentile data points.

This year marks our first use of the new hosting platform for the survey using software by Peerfocus. The new environment affords increased security and data validation capabilities, and will soon provide the ability for CRA member respondents to select obtain certain survey information for a self-selected peer group.

We thank all respondents to this year's questionnaire. Departments that participated are listed at the end of this article.

## Doctoral Degree Production, Enrollments and Employment

## (Tables DI-D10; Figures DI-D6)

After two straight years of record Ph.D. production, the number of doctoral degrees produced by the reporting departments declined 2.6 percent, from 1,991 to 1,940. Among all departments reporting both this year and last year, the number of total doctoral degrees declined by 4.1 percent, and among U.S. CS departments reporting both years, the decline was 3.7 percent. An examination of the data by area of computing shows that the entire aggregate decline in degrees produced is in the computer engineering area. The number of CS doctoral degrees produced was steady (1,651 by departments reporting this year vs. 1,653 by departments reporting last year), and the number of I degrees increased (154 vs. 120). The CE and I numbers are strongly influenced by the specific departments responding in

| Department Type | $\begin{gathered} \text { \# } \\ \text { Depts } \end{gathered}$ | PhDs Awarded |  | PhDs Next Year |  | Passed Qualifier |  | Passed Thesis (if dept has) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | \# | Avg/ Dept | \# | Avg/ Dept | \# | Avg/ Dept | \# | \# Dept | Avg/ Dept |
| US CS Public | 96 | 1,228 | 12.3 | 1,298 | 13.5 | 1,290 | 14.2 | 1,027 | 80 | 11.8 |
| US CS Private | 34 | 378 | 11.1 | 487 | 14.3 | 414 | 12.9 | 214 | 24 | 8.8 |
| US CS Total | 130 | 1,606 | 12.0 | 1,785 | 13.7 | 1,704 | 13.9 | 1,241 | 104 | 11.1 |
| US CE | 10 | 90 | 9.0 | 117 | 11.7 | 215 | 19.5 | 136 | 7 | 28.9 |
| US Info | 13 | 98 | 8.2 | 89 | 6.8 | 103 | 7.9 | 65 | 10 | 8.0 |
| Canadian | 12 | 146 | 13.3 | 168 | 14.0 | 107 | 10.7 | 91 | 9 | 12.8 |
| Grand Total | 165 | 1,940 | 11.6 | 2,159 | 13.1 | 2,129 | 13.6 | 1,533 | 130 | 12.0 |

a given year, since we receive data from only a small number of these departments.

Women comprised 17.6 percent of CS doctoral graduates and 18.9 percent of all doctoral computing graduates, both values being slightly higher than those reported last year. The fraction of CS doctoral degrees that went to Non-resident Aliens was 60.1 percent, up from 58.7 percent, while the fraction that went to resident Asians dropped a corresponding amount. Among I doctoral degrees, the fraction going to Non-resident Aliens and Whites both declined (each was 34.7 percent in 2013-14), while the fraction going to resident Asians, Blacks and Hispanics increased. However, the raw number of I degrees to Blacks and Hispanics is still in the single digits. Within CE, women comprised 11.9 percent of the 2013-14 graduates, up from 11.2 percent in 2012-13, and Non-resident Aliens comprised 77.9 percent of the graduates.

The fraction of doctoral graduates who were American Indian or Alaska Native, Black or African American, Native Hawaiian/

Pacific Islander, Hispanic, or Multiracial Non-Hispanic dropped to 2.6 percent from 3.4 percent in CS, and was 3.4 percent in aggregate across CS, CE and I (vs 3.3 percent in 2012-13). Within CS, Non-resident Aliens and Resident Asians comprised a higher percentage of the female doctoral graduates than they did male graduates, while Whites comprised a lower percentage of the female graduates as compared with male graduates (Table D9).

Among currently enrolled CS doctoral students whose ethnicity is known, we see the same direction of difference among Non-resident Aliens, Asians and Whites; Non-resident Aliens and Resident Asians comprise a higher percent of the enrolled women than they do the enrolled men, and Whites comprise a lower percentage of enrolled women. This is similar to the observations last year.

Among those pursuing I degrees, 56.5 percent of the men but only 49.1 percent of the women are Non-resident Aliens or Resident Asians. This is different from last year, when there

were no appreciable differences in the percentages with respect to gender. Similar to last year, there is no appreciable difference in the percentage of men vs the percentage of women among Whites pursuing I degrees. Among those pursuing CE doctoral degrees, 19.5 percent of the men but only 12.0 percent of the women are White, while 79.8 percent of the women but only 74.7 percent of the men are either Nonresident Aliens or Resident Asians.

The average number of students per department who passed qualifier exams during 2013-14 in U.S. CS departments is similar to that reported last year among both public and private departments. The average number per department who passed thesis candidacy exams (most, but not all, departments have such exams) also was similar to last year among both public and private departments (Table DI).

The number of new Ph.D. students at departments reporting this year increased slightly compared with the total from last year's reporting departments. This reflects increases in CS and I departments and a small decrease in CE departments.

Among all departments that reported both years, the number of new Ph.D. students increased 3.6 percent. If only U.S. CS departments that reported both years are considered, the increase was 4.7 percent. The proportion of new doctoral students from outside North America continues to increase. This year's proportion is 62.6 percent while last year's was 60.2 percent. U.S. CS departments (both public and private) and Canadian departments had increases, while U.S. CE and U.S. I departments had declines.

Among programs that reported both years, total doctoral enrollment increased 4.4 percent. If only U.S. computer science departments are considered, the increase was 3.9 percent. Total doctoral enrollment by gender is in about the same proportion reported last year (Table D7). The fraction of doctoral students who are not either Non-resident Aliens, Asian or White remains at below 5 percent (Table D8).

Figure D5 shows a graphical view of the Ph.D. pipeline for computer science programs. The data in this graph are normalized by the number of departments reporting. The graph

offsets the qualifier data by two years from the data for new students, and offsets the graduation data by five years from the data for new students. These data have been useful in estimating the timing of changes in production rates. The graph suggests that doctoral production will remain fairly steady during the next few years, though the departments are forecasting an increase in production during 2014-15.

Figure D6 shows the employment trend of new Ph.D.s in academia and industry, those taking employment outside of North America, and those going to academia who took positions in departments other than Ph.D.-granting CS/CE departments. Table D4 shows a more detailed breakdown of the employment data for new Ph.D.S. The fraction of new Ph.D.s who took positions in North American industry rose to an historic record of 57.5 percent in 2013-14, eclipsing the previous high of 56.6 percent set in 2007-08. Among those doctoral graduates who went to North American industry and for whom the type of industry position was known, about 56 percent took research positions. This is down from the 64 percent reported last year. This year, definitive data was provided for

87 percent of the graduates who went to industry, up from the 80 percent provided last year.

Only 27.3 percent of 2013-14 graduates took North American academic jobs, an all-time low since we began tracking this in 1989-90. In 2012-13 this figure was 30.6 percent. The fraction taking tenure-track positions in North American doctoral granting computing departments held fairly steady at 7.6 percent for 2013-14 graduates. The fraction taking positions in North American non-Ph.D.-granting computing departments dropped from 2.1 percent to 1.9 percent. The fraction taking North American academic postdoctoral positions dropped from 14.9 percent to 11.6 percent.

The proportion of Ph.D. graduates who were reported taking positions outside of North America, among those whose employment is known, rose to 9.4 percent from 8.2 percent for 2012-13 graduates. About 37 percent of those employed outside of North America went to industry (slightly higher than reported last year), about 26 percent went to tenure-track academic positions (about the same as reported last year) and almost 20 percent went to academic postdoctoral positions

Figure D3. PhD Degrees Granted by Tenure-Track Size CRA Taulbee Survey 2014

Figure D4. PhD Enrollment Normalized by Tenure-Track Size
CRA Taulbee Survey 2014

(a higher rate than reported last year). Of the doctoral graduates who went to non-North American industry positions, the positions were research by a three-to-one margin over those that were not research, the same ratio reported last year. Definitive data was provided for 91 percent of these graduates.

Employment in industry postdoctoral positions is included in the overall industry numbers. When academic and industry postdocs are combined, the result is that 15.6 percent of 201314 doctoral graduates took some type of postdoctoral position, down from 18.1 percent last year. Approximately 14 percent of these were industry postdocs, a slightly higher fraction than was reported last year.

The unemployment rate for new Ph.D.s again this year was below one percent. The fraction of new Ph.D.s whose employment status was unknown was 19.7 percent in 201314; in 2012-13 it was 20.8 percent. It is possible that the lack of information about the employment of more than one in six graduates skews the real overall percentages for certain employment categories.

Table D4 also indicates the areas of specialty of new Ph.D.s. Artificial intelligence, networking, software engineering and databases, in that order, continue to be the most popular areas of specialization for doctoral graduates.

## Master's and Bachelor's Degree Production and Enrollments

This section reports data about enrollment and degree production for Master's and Bachelor's programs in the doctoral-granting departments. Although the absolute number of degrees and enrolled students reported herein only reflect departments that offer the doctoral degree, the trends observed in the master's and bachelor's data from these departments tend to strongly reflect trends in the larger population of programs that offer such degrees.

## Master's (Tables MI-M8; Figures MI-M2)

On a per-department basis, master's degree production in CS remained fairly constant in 2013-14; this is the second year in a row that master's production held steady. However, this year there was increased production among U.S. public departments, while U.S. private departments had a decrease in production; this is the opposite of what took place last year.

Overall production of master's degrees in the information area rose in 2013-14, as it did the previous year. Both U.S. public and
U.S. private CS departments reported decreases in the number of information Master's degrees produced, while I departments reported substantially increased production of information master's degrees. This, too, is the opposite of what took place last year, although the increased number of I departments responding this year likely influenced these results.

The proportion of female graduates among master's degree recipients remained fairly constant in all three computing areas (CS, CE and I). The range was from 22.0 percent in CS to 48.4 percent in I. In both CS and I, the fraction of the master's recipients that were Non-resident Aliens increased in 2013-14 as compared with 2012-13. In CS, 67.8 percent of the master's degrees went to Non-resident Aliens, compared with 65 percent in 2012-13. In the information area, the corresponding percentages were 28.1 in 2013-14 and 24.9 in 2012-13. In both CS and I, the fraction of master's degrees going to Whites and resident Asians declined.

Looking more deeply into the gender and ethnicity degree data (Table M7), we find that Non-resident Aliens comprised a much larger proportion of female CS degree recipients (74.7 percent) than male CS degree recipients ( 65.8 percent), while Whites

Table M1. Master's Degrees Awarded by Department Type

| Female | 1,641 | $22.0 \%$ | 156 | $24.1 \%$ | 1,299 | $48.4 \%$ | 3,096 | $28.7 \%$ |
| Total Known Gender | 7,454 |  | 647 |  | 2,685 |  | 10,786 |  |
| Gender Unknown | 34 |  | 0 |  | 1 |  | 35 |  |
| Grand Total | 7,488 |  | 647 |  | 2,686 |  | 10,821 |  |

comprised a larger percentage of male CS degree recipients (23.8 percent) than female CS degree recipients (13.8 percent). With somewhat differing percentages, the same observations held for CE master's graduates. In the I area, Non-resident Aliens comprised a larger percentage of male master's graduates than female master's graduates, and a smaller fraction of White master's graduates. The current enrollment breakdown by gender and ethnicity (Table M8) suggests that these observations will continue to be reflected in future master's recipients.

For the third straight year, there were large increases in the number of new master's students enrolled in U.S. CS public
departments. These increases have begun to be reflected in degree production statistics, as noted above.

The fraction of new master's students in U.S. CS departments that is reported to be from outside North America declined from 69.6 percent in 2013-14 to 64.5 percent in 2014-15 (Table M5). The decline reverses last year's reported increase, and was strongest in private institutions, where it dropped from 70.5 percent to 58.0 percent. At U.S. information departments, the fraction of new master's students from outside North America increased by approximately seven percentage points for the second consecutive year. It is now at 43.5 percent.

Figure M2. Master's Enrollment Normalized by Tenure-Track Size
CRA Taulbee Survey 2014

## Bachelor's (Tables 1, BI-B8; Figures BI-B4)

When comparing all departments reporting this year to all departments reporting last year, there was an increase of 14.3 percent in bachelor's degree production. When considering only those departments that reported both years, the increase was 12.0 percent. Among U.S. computer science departments, the increases were 14.2 percent when comparing totals for all reporting departments and 13.6 percent for those departments that reported both years.

These double-digit percentage increases contrast with the small growth in bachelor's degree production reported in last year's survey. But they are consistent with the statement we made last year that the enrollment changes experienced during the past several years were expected to result in much higher growth in degree production.

The number of new undergraduate computing majors rose for the seventh straight year. The increase was 20.2 percent when all respondents are compared, and 18.0 percent among those departments reporting both this year and last year. Among U.S. computer science departments, the increase was 18.3 percent overall and 17.0 percent among departments reporting both this year and last year. Total undergraduate enrollment in computing majors among U.S. CS departments (i.e., the sum of the number of majors in CS, CE and I at these departments) increased 27.3 percent when all respondents are compared, and increased 18.6 percent among departments reporting both this year and last year.

Aggregate total enrollment (which combines CS departments, CE departments, I departments and Canadian departments) increased in all three computing areas (CS, CE, and I). New student enrollment also increased in all three areas. In Canadian departments, total computer science enrollment decreased though the average per department increased, while both the total enrollment and average per department decreased for Canadian I programs. In U.S. CS departments at private institutions, CE and I total enrollments declined but the average per department increased. The changes in Canadian, CE and I enrollments are more volatile due to the small number of departments reporting in each of these areas.

The fraction of women among 2013-14 bachelor's graduates in CS was 14.1 percent, similar to the 14.2 reported for 2012-13. There was a slight drop in the fraction of women receiving CE degrees (from 11.6 percent to 11.2 percent) but there was an increase for I degrees (from 18.7 percent to 20.3 percent). The fraction of CS bachelor's degrees awarded to Whites declined from 61.2 percent in 2012-13 to 57.7 percent in 2013-14, and the percentage awarded to Blacks declined from 3.8 percent to 3.2 percent. Increases in the fraction of CS degrees awarded were present for Non-resident Aliens ( 8.3 percent to 9.0 percent), Asians ( 18.4 percent to 21.1 percent), and Hispanics ( 6.0 percent to 6.8 percent). The direction of change was similar for I degrees with the exception of Blacks, which increased slightly between 2012-13 and 2013-14. In CE, there was an increase in the fraction of Non-resident Aliens and Hispanics

receiving degrees, with the percentage of Whites showing the largest decline. In aggregate across the three degree areas, 56.7 percent of the graduates were White, 20.8 percent Asian, 8.3 percent Non-resident Aliens, and 14.2 percent all other ethnicity categories combined. However, in I programs, the other ethnicity categories accounted for over 20 percent of the graduates and account for more than 25 percent of the current enrollment.

In all three computing areas (CS, CE and I), Resident Asians comprise a larger fraction of female degree recipients than male recipients, while Whites comprise a larger fraction of male degree recipients than female recipients (Table B7). Table B8 indicates that the same comparisons hold true for total bachelor's enrollment, so these comparisons are likely to continue holding true for future degree recipients.

## Faculty Demographics (Tables Fl-F9)4

Table Fl shows the current and anticipated sizes, in FTE, for tenure-track, teaching and research faculty, and postdocs. The total tenure-track faculty count in U.S. CS departments $(3,559)$ is about the same as last year. However, there was an increase from last year to this year, from 26.2 to 27.4, in the average tenure-track faculty size per U.S. CS department. In these departments, there also were increases in the number of teaching and research faculty per department and the number of postdocs per department. Canadian, CE and I departments have much more volatile data due to the small number of departments reporting in each of those categories.

As we have mentioned in previous Taulbee reports, Canadian universities, on average, have several more tenure-track faculty members per department than do U.S. universities, while on average U.S. I departments and U.S. CE departments are slightly smaller than U.S. CS departments. The observations about U.S. CE and I departments may reflect the fact that we ask departments to report only computing-related faculty, so departments with Library Science or EE programs may report only part of their faculty.

Among U.S. CS departments, those at private universities tend to have more tenure-track, teaching faculty, research faculty and postdocs than do those at public universities on average. This observation also was made last year.

Table F2 summarizes faculty hiring this past year. There were more tenure-track vacancies per reporting department (2.09) in 2013-14 than in2012-13 (1.98). U.S. CS departments had a slightly greater average in 2013-14 than in 2012-13, due to increases per public department. In aggregate, only 21.2 percent of the total number of vacant tenure-track positions went unfilled; in 2012-13 there were 33.0 percent unfilled. The success rate at U.S. CS departments jumped from 64.0 percent in 2012-13 to 80.2 percent in 2013-14; increased success was enjoyed at both public and private departments. Canadian departments had lower success rates on average than did U.S. CS, U.S. CE and U.S. I departments. In aggregate, there was more hiring in 2013-14 than in 2012-13 in all categories of faculty.

The fraction of women among those hired into all categories of academic positions (tenure-track, teaching faculty, research faculty and postdoc) was 22.1 percent in 2012-13, an increase from 21.0 percent in $2012-13$ (Table F3). However, in tenure-track positions, the fraction was similar to the previous year (21.8
percent vs. 22.5 percent in 2012-13). There were increases in the fraction of research faculty positions and postdoc positions going to women as compared with those reported last year, while the fraction of teaching positions going to women decreased. The fraction of new female tenure-track and overall faculty hires continues to exceed the fraction of new female Ph.D.s produced this past year (18.9 percent).

Among new tenure-track faculty, the fraction who are white rose from 47.4 percent to 49.5 percent, while the fraction who are Non-resident Alien or Asian new hires dropped from 44.0 percent to 41.8 percent. Once again, whites dominated the newly hired teaching faculty, with Asians and Non-resident Aliens accounting for most of the remainder. Among research faculty, whites comprised 42.9 percent of new hires, while Non-resident Aliens or resident Asians in aggregate comprised 47.6 percent of new hires. Among postdoc new hires, whites comprised 37.6 percent, with Non-resident Aliens and resident Asians collectively comprising 51.1 percent (Table F4).

There were more faculty losses reported this year as compared with last year (Table F5); this is the second consecutive year we observed this. Once again, the larger fraction of losses is due to movement to another (academic or non-academic) position.

This year, the fraction of women at the full professor rank was about the same as last year, while the fraction at the associate professor level rose (from 19.6 percent last year to 20.5 percent this year) and the fraction at the assistant professor level fell (from 26.2 percent to 24.6 percent) (Table F6). There also were increases in the fraction of women among research faculty and postdocs, while there was a decrease in the fraction of women among teaching faculty. Whites, Asians and Non-resident Aliens again account for about 90 percent of each category of faculty members (Table F7).

Ninety-five percent of departments provided gender by ethnicity breakdowns for their current faculty members. (Table F8 And F9). Whites comprised a greater percentage of female full professors than they do male full professors, while the reverse is true at the associate professor level. Asians comprise a greater percentage of male full professors than they do female full professors, while the reverse is true at the associate professor level.

For next year, U.S. CS departments forecast a modest 2.1 percent growth in tenure-track faculty, and a 5.6 percent growth in teaching faculty. However, they forecast an 11.8 percent growth in postdocs.

## Research Expenditures (Table R1; Figures RI-R2)

Table RI shows the department's total expenditure (including indirect costs or "overhead" as stated on project budgets) from external sources of support. Figures R1 and R2 show the per capita expenditure, where capitation is computed two ways. The first (Figure RI) is relative to the number of tenuretrack faculty members. The second (Figure R2) is relative to researchers and postdocs as well as tenure-track faculty. Canadian levels are shown in Canadian dollars.

Overall median research expenditures for 2013-14 at U.S. CS public departments rose 5.5 percent in comparison with 2012-13. At U.S. CS departments in private institutions, median expenditures rose 2.7 percent. However, the median research expenditure at U.S. CS departments in private institutions is
more than 25 percent higher than that at public institutions. Median expenditures also rose at U.S. CE departments, but fell at U.S. I departments and Canadian departments in comparison with 2012-13. The CE, I and Canadian departments are based on much smaller samples, which makes these comparisons subject to more volatility.

The U.S. CS data for public institutions indicate that the larger the department, the more external funding is received by the department (both in total and per capita). Research expenditures at private institutions were less affected by the size of the department, though per capita they also tended to rise with department size. Both of these observations are consistent with what we reported in previous years.

## Graduate Student Support (Tables GI-G2; Figures Gl-G3)

Table Gl shows the number of graduate students supported as full-time students as of fall 2014, further categorized as teaching assistants (TAs), research assistants (RAs), and full-support fellows. The table also shows the split between those on institutional vs. external funds. The total number of TAs on institutional funds in U.S. CS departments increased 14.6 percent this year. Public universities reported a 21.3 percent increase, while private universities reported a 14.2 percent decrease (though there were somewhat fewer private universities reporting this year). In last year's report, private universities reported over a 25 percent increase. It is possible that there were some inconsistencies between years in departmental reporting.

There was an overall decrease of 36 percent in the number of RAs that were supported on institutional funds at U.S. CS departments. Significant decline existed at both public and private universities. The number of RAs on external funding increased by 18.6 percent in U.S. CS departments at public universities, but decreased by 11.5 percent in departments at private universities. In this case, we see both public and private institutions experiencing just the reverse of what was experienced in last year's report. However, there were fewer private universities reporting this year, which likely is the most significant reason why the raw numbers declined.

The number of full-support fellows on external funds declined in U.S. CS departments at public universities, but rose slightly
at private universities. However, the number of full-support fellows supported on institutional funds rose over 40 percent in both public and private universities.

There are many substantial differences between this year and last year in the data from U.S. CE and I departments, and from Canadian departments. The fairly small number of departments in each of these categories makes such large changes more probable.

Table G2 shows the distribution of stipends for TAs, RAs, and full-support fellows. U.S. CS data are further broken down in this table by public and private institution. Figures G1-G3 further break down the U.S. CS data by size of department and by geographic location of the university.

The median TA salaries at U.S. CS departments rose 5.6 percent at public universities and 4.1 percent at private universities. Median salaries of RAs rose, respectively, 6.0 and 6.9 percent at public and private universities. For full support fellows, median salaries rose 2.8 percent at U.S. public universities and 19.7 percent at U.S. private universities.

Larger departments at U.S. public universities tend to offer higher stipends to both TAs and RAs than do smaller departments, and private universities tend to offer higher stipends to all categories of grad students than do public universities. As was the case last year, departments located in larger population centers also tend to pay higher stipends to TAs and RAs; the data for full-support fellows exhibits no clear trend relative to locale at public universities.

## Faculty Salaries (Tables S1-S21; Figures S1-S9)

Each department was asked to report individual (but anonymous) faculty salaries if possible; otherwise, the department was requested to provide the mean salary for each rank (full, associate, and assistant professors and non-tenure-track teaching faculty, research faculty, and post-doctorates) and the number of persons at each rank. The salaries are those in effect on January 1, 2015. For U.S. departments, nine-month salaries are reported in U.S. dollars. For Canadian departments, twelve-month salaries are reported in Canadian dollars. Respondents were asked to include salary supplements such as salary monies from endowed positions.
U.S. CS data are reported in Tables S1-S16 and in the box and whiskers diagrams. Data for CE, I, Canadian and new Ph.D.s are reported in Tables SI7-S20. The tables and diagrams contain distributional data (first decile, quartiles, and ninth decile) computed from the department averages only. Thus, for example, a table row labeled " 50 " or the median line in a diagram is the median of the averages for the departments that reported within the stratum (the number of such departments reporting is shown in the "depts" row). It therefore is not a true median of all of the salaries.

We also report salary data for senior faculty based on time in rank, for meaningful comparison of individual or departmental faculty salaries with national averages. We report associate professor salaries for time in rank of 7 years or less, and of more than 7 years. For full professors, we report time in rank of 7 years or less, 8 to 15 years, and more than 15 years.

Those departments reporting salary data were provided a summary report in December 2014. Those departments that provided individual salaries were additionally provided more comprehensive distributional information based on these individual salaries. This year, about 75 percent of those reporting salary data provided salaries at the individual level.

The remainder of this section updates the basic report provided in December to all departments that provided salary data. It reflects salary data received since the deadline for that report.

Similar to past years, the data show that salaries at private universities tend to be higher than those at public universities
in all faculty strata (Tables S2 and S3). At public universities, salaries tend to be higher for larger departments (Tables S4-S8). At private universities, full professor salaries are somewhat higher in smaller locales, while associate professor salaries are somewhat lower in smaller locales. Public university salaries appear to be generally lower in smaller locales for non-tenure-track faculty and for tenure-track associate and assistant professors.

To provide a more meaningful comparison of this year's salaries with those from last year's Taulbee report, we use only those departments that reported both years. Because some departments that reported both years provided only aggregate salaries for their full and associate professors during one year and in the other year reported them by years in rank, we only include the salaries for all full professors and for all associate professors in the year-toyear comparison. Table S2l shows the change in median of the average salaries in departments that reported both years (the number of departments being compared is indicated in each column). The table indicates that the median of the average salaries has increased by 2-3 percent from 2013-14 to 2014-15 in most categories of faculty.

When interpreting these changes, it is important to remember the effect that promotions have on the departmental data from one year to the next, since individual faculty members move from one rank to another. Thus, a department with a small number of faculty members in a particular rank can have its average salary in that rank change appreciably (in either direction) by a single promotion to or from that rank. Departures via resignation or retirement also impact these figures, particularly in the non-tenure-track categories. Because of the small number of Canadian and Computer Engineering departments reporting, the values in those columns are considerably more volatile.

For new Ph.D.s in tenure-track positions at U.S. computer science, computer engineering, and I-school departments (Table S20) the median of the averages increased by 2.5 percent vs. last year. Canadian departments did not report any salaries this year for new Ph.D.s in tenure-track, teaching, or non-tenure-track research positions.

## Concluding Observations

There is seemingly relentless teaching pressure on academic computing departments from the undergraduate demand. Yet, for the fourth time in five years, the fraction of doctoral graduates who took tenure-track positions at doctoral-granting departments declined. Industry continues to employ majority of doctoral graduates, with most of those going to industry taking research positions where the nature of their industry position is known. The struggles that academic departments face in coping with the increased demand remind us of the high growth eras in the 80s and 90s.

## Participating Departments

US CS Public (103): Arizona State, Auburn, Clemson, College of William \& Mary, Colorado School of Mines, Colorado State, Florida International, Florida State, George Mason, Georgia Tech, Georgia State, Indiana, Iowa State, Kansas State, Kent State, Louisiana State, Michigan State, Michigan Technological University, Mississippi State, Missouri Science \& Technology, Montana State, Naval Postgraduate School, New Jersey Institute of Technology, New Mexico State, North Carolina State, North Dakota State, Ohio State, Ohio, Oklahoma State, Old Dominion, Oregon State, Pennsylvania State, Portland State, Purdue, Rutgers, Stony Brook (SUNY), Temple, Texas A\&M, University at Albany, Universities of: Alabama (Birmingham and Tuscaloosa), Arizona, Arkansas, Arkansas at Little Rock, California (Berkeley, Davis, Irvine, Los Angeles, Riverside, San Diego, Santa Barbara, and Santa Cruz), Central Florida, Colorado (Boulder), Connecticut, Delaware, Florida, Georgia, Hawaii, Houston, Idaho, Illinois (Chicago and Urbana Champaign), Iowa, Kansas, Kentucky, Louisiana at Lafayette, Maryland (College

Park and Baltimore County), Massachusetts (Amherst and Boston), Michigan, Minnesota, Mississippi, Missouri (Columbia), Nebraska (Omaha and Lincoln), Nevada (Reno), New Hampshire, North Carolina (Chapel Hill and Charlotte), North Dakota, North Texas, Oklahoma, Oregon, Pittsburgh, Rhode Island, South Carolina, South Florida, Tennessee (Knoxville), Texas (Austin, Dallas, and El Paso), Utah, Vermont, Virginia, Washington, Wisconsin (Madison), Wyoming, Virginia Tech, Washington State, Western Michigan, and Wright State.

US CS Private (34): Boston University, Brown, Carnegie Mellon, Case Western Reserve, Columbia, Cornell, DePaul, Drexel, Duke, Florida Institute of Technology, Harvard, Illinois Institute of Technology, Johns Hopkins, Lehigh, MIT, New York University, Northeastern, Pace, Princeton, Rensselaer, Rice, Rochester Institute of Technology, Stanford, Stevens Institute of Technology, Toyota Technological Institute at Chicago, Tufts, Universities of: Chicago, Pennsylvania, Rochester, Southern California, and Tulsa, Washington in St. Louis, Worcester Polytechnic Institute, and Yale.

US CE (10): Florida Institute of Technology, Iowa State, North Carolina State, Princeton, Purdue, Santa Clara, Universities of: California (Santa Cruz), Illinois (Urbana Champaign), New Mexico, and Southern California, and Virginia Tech.

US Information (15): Cornell, Drexel, Florida State, Indiana, Penn State, Syracuse, University at Albany (SUNY), Universities of: California (Berkeley and Santa Cruz), Illinois (Urbana Champaign), Maryland (Baltimore County), Michigan, North Carolina (Chapel Hill), Pittsburgh, and Washington.

Canadian (II): Concordia, McGill, Simon Fraser, Universities of: British Columbia, Calgary, Manitoba, New Brunswick, Toronto, Victoria, Waterloo, and Western Ontario.
${ }^{1}$ The title of the survey honors the late Orrin E. Taulbee of the University of Pittsburgh, who conducted these surveys for the Computer Science Board until 1984, with retrospective annual data going back to 1970.
${ }^{2}$ Information (I) programs included here are Information Science, Information Systems, Information Technology, Informatics, and related disciplines with a strong computing component. Surveys were sent to CRA members, the CRA Deans group members, and participants in the iSchools Caucus (www.ischools.org) who met the criteria of granting Ph.D.s and being located in North America. Other I-programs who meet these criteria and would like to participate in the survey in future years are invited to contact survey@cra.org for inclusion.
${ }^{3}$ Classification of the population of an institution's locale is in accordance with the Carnegie Classification database. Large cities are those with population $>=250,000$. Mid-size cities have population between 100,000 and 250,000 . Town/rural populations are less than 100,000.
${ }^{4}$ All faculty tables: The survey makes no distinction between faculty specializing in CS vs. CE programs. Every effort is made to minimize the inclusion of faculty in electrical engineering who are not computer engineers.

# Expanding the Pipeline: 

## Booming Enrollments - What is the Impact?

By Lecia Barker (University of Texas at Austin), Tracy Camp (Colorado School of Mines), Ellen Walker (Hiram College), and Stu Zweben (Ohio State University)

Computing Research Association Women

## Introduction

We are in the throes of another undergraduate enrollment surge. The number of new CS/CE majors in bachelor's programs at Taulbee departments this year has reached the peak levels seen at the end of the dot-com era. While this is better news than the opposite (declining enrollments), it is critical that the field take into account how policies and efforts to manage the enrollment surge will affect groups that are under-represented in computing. The Taulbee Survey shows a three-year increase of approximately 61 percent in undergraduate enrollment at U.S. CS departments between 2010-1ו and 2013-14. We also note that the booming enrollments are not limited to doctoral granting universities. For the past two years, ACM has sponsored a survey similar to the Taulbee Survey, but which collects data from Non-doctoral granting Departments in Computing (NDC). The most recent study included data from 164 institutions representing 302 programs at the bachelor's level. Between 2012-13 and 2013-14, these institutions saw more than a $16 \%$ increase in CS degree production and over 7\% increase in total CS enrollment.

## How are Universities Accommodating the Undergraduate Boom?

At the 2015 ACM SIGCSE conference in March, the authors held a discussion with about 150 computer science educators to understand how universities are dealing with increasing enrollments. Three general approaches were presented (which are not mutually exclusive), including managing staffing, class sizes and formats, and administrative policies.

- Staffing approaches: increasing teaching assistant staff, both graduate and undergraduate; using undergraduate peer advisors; partnering with other departments to teach interdisciplinary majors; creating lines for tenure-track faculty and/or teaching faculty; hiring adjuncts (e.g., adjunct faculty at NDC institutions increased by 175\% from 2012-13 to

2013-14); hiring Ph.D. students (from neighboring institutions for NDC institutions); imposing teaching overloads on faculty; and other approaches, such as keeping some faculty in reserve to teach courses as needed (if not needed, they can teach their favorite elective instead).

Class size and format: increasing class sizes, changing course structure (e.g., from individual sections to large lecture with recitations), and using online or blended courses.

- Policies and predictions: changing course sequences; reducing pre-requisites to influence course-taking patterns; reducing number of electives to cover core courses; conducting surveys and/or tightening pre-requisites to improve course-taking predictions; eliminating non-major service courses; increasing student fees to support hiring needs; and imposing policies to cap enrollment.

Each of these approaches has implications for managing departments; e.g., teaching assistants require training and management and charging student fees requires approval beyond the department. In addition, some of the approaches may not be feasible. For example, although we are producing new Ph.D.s at record or near record numbers, about 60\% are going to industry. Meanwhile, graduate enrollments have been stable the last few years, which suggests that there is limited capacity to handle growing undergraduate enrollments via the hiring of new doctoral graduates. Furthermore, some approaches may have especially negative consequences for diversity.

## How Might the Enrollment Boom Affect Diversity Efforts?

The U.S. computing community has put enormous effort into diversifying the field. Diversity is a social justice issue given the huge industry demand and high salaries associated with the demand, but also critical for innovation and problem solving (as shown by numerous studies). Programs like the National Science Foundation's Broadening Participation in

Computing and code.org have made significant inroads into formal and informal education. The students interested in computing are now more diverse than ever, yet the way the enrollment boom is managed could divert promising undergraduates into other majors.

Enrollment caps can help departments reduce the number of students who take courses or declare a major. Some course enrollment caps are simply based on a first-come, firstserved approach or in randomization, so that students have a more or less equal chance to be admitted into classes or the major. Yet many departments go beyond FCFS, to give priority to students who are willing to declare the major. Students who take computer science in high school are more likely to declare the computer science major, are more likely to be a white or Asian male, and are more likely to be from a school large enough to have computer science classes. In contrast, underrepresented students and those from high schools without computer science courses are increasingly intrigued by computing and want to try it out for the first time as undergraduates. Enrollment policies influenced by pre-college course-taking limits access by women, underrepresented minorities, and rural (under-resourced) areas.

Charging differential tuition or fees is another way that departments can accommodate increased teaching staff and lab expenses. However, research shows that differential costs are likely to more negatively impact students who are first in family to go to college or come from less affluent backgrounds.

Even when students can be accommodated, the need to scale course size may also negatively impact retention of underrepresented groups in computing. Large lecture courses are less personal, with less faculty-student and studentpeer interaction, two significant predictors of retention in computer science. Students can also have less information on which to judge their progress relative to their peers. In addition, when courses are large, it can be harder to establish ties with the peer networks that support learning and the development of identity as a person who belongs in the field. Women and under-represented minorities in computing also stand out as different and become isolated. Research shows that women leave computer science not because of their grades (which are typically higher than the men who stay), but because they are isolated, don't
understand their standing relative to peers, and feel the social climate is uncomfortable.

## Will the Undergraduate Enrollment Boom Lead to a Graduate Enrollment Boom?

Some of the growth in interest in computer science appears to be tied to the availability of immediate, lucrative employment with a bachelor's degree. For these students, the pipeline from undergraduate degree programs to graduate degree programs is likely to remain static. And, as mentioned, Taulbee data shows that graduate enrollments have been stable the last few years, with an increasing fraction of new graduate students from outside North America. Many attendees at our SIGCSE session, however, agreed that the current boom feels different than the dot.com boom. Specifically, SIGCSE panel attendees indicated that students taking computing classes during the dot.com boom seemed to mainly be interested in money, but now appear to be interested in computing. This interest is illustrated by the large increase in REU site applications seen by many universities, which indicates a graduate enrollment boom might be forthcoming.

## Conclusions

Our field has faced booming enrollments twice in the past: in the mid-1980s and in the late 1990s. This one feels different to many of us. At the 2014 CRA Conference at Snowbird, we saw data from some universities that showed higher than ever demand for more advanced computing courses by students who were not computing majors. Since the previous surge, there has been a maturing of the computing disciplines of software engineering and information technology, and new areas such as security are on the rise. During the past decade, there has been an increase in the number of interdisciplinary programs that involve computing and demand for courses well beyond the introductory level. Students from all fields are much more aware of the power that computational abilities give to them within their chosen major. This is great news for the computing community. After the last boom, however, there was a considerable decline in gender diversity for both majority (e.g., white) and minority (e.g., Hispanic) populations. We need to be especially careful with our enrollment policies and practices right now, so that the computing community can benefit from the diversity that exists in the enrollment boom we currently face.

# ACM Appoints New Representative to CRA Board 

Mary Hall replaces Mary Fernández as one of the ACM Representatives on the CRA Board.

Mary Hall is a Professor in the School of Computing at the University of Utah, where she has been since 2008. She conducts research in programming language and compiler technology for parallel and highperformance computing architectures. Her current research focuses on automatic performance tuning of scientific and data analytics applications, which involves close collaboration with architects, computational scientists and domain scientists. She has previously served ACM through membership in awards and conference steering committees, leadership roles in conference organization, and most significantly, as member of the ACM History Committee for the past decade, and chair from 2009-2013. She has also served IEEE as a member of the Computer Society Award Committee, chair of the ACM/

#### Abstract

IEEE Kennedy Award Committee, and member of the Cray and Fernbach Award Committees. She has participated in several CRA-W mentoring workshops as both attendee and speaker, and this year's CRA Leadership in Science Policy Institute. She has co-authored numerous reports for government agencies, particularly NSF, DOE and DARPA, to establish the research agenda in compilers and high-performance computing. Professor Hall is an ACM Distinguished Scientist. She received an M.S. and Ph.D. in Computer Science from Rice University, in 1989 and 1991, respectively, and graduated Magna Cum Laude in 1985 with a B.A. in Computer Science and Mathematical Sciences also from Rice University. Prior to joining Utah, Professor Hall was jointly a research associate professor and project leader at University of Southern California, and previously held research positions at Caltech, Stanford and Rice.

## Engaging Undergraduates in Research: Upcoming Workshops at ICRA and FCRC

CRA-E
Computing Research Association
Education

The Education Committee of the Computing Research Association (CRA-E) is sponsoring workshops for faculty members interested in mentoring undergraduate research. The next two workshops are at ICRA (Seattle, Saturday May 30, 12-1:30 PM, lunch provided) and FCRC (Portland, Monday, June 15, 6-7:30 PM, appetizers provided). The workshops are free.

The objectives of these workshops are to provide faculty with resources and best practices for engaging undergraduates in their research, identifying funding sources for undergraduate
research, and encouraging undergraduates to consider careers in research. To ensure a healthy pipeline of students motivated to continue on to graduate school, it is critically important that talented undergraduates obtain meaningful research experiences. Having faculty who are well-prepared to supervise undergraduate research can make a difference.

The workshops are funded by the National Science Foundation. Please see the CRA-E's workshop page for more information and instructions for registering.

## May 2015 CERP Infographic

By: Jane Stout, CERP Director

## Ph.D. students' choice of specialty area differs among women and men

| Top 10 Specialty Areas |  |
| :---: | :---: |
| Women | Men |
| 1 Artificial Intelligence | 1 Artificial Intelligence |
| 2 Human-Computer Interaction | 2 Databases / Information Retrieval |
| 3 Databases / Information Retrieval | 3 Software Engineering |
| 4 Software Engineering | 4 Programming Languages / Compilers |
| 5 Graphics/Visualization | 5 Theory and Algorithms |
| 6 Robotics / Vision | 6 Networks |
| 7 Theory and Algorithms | 7 Human-Computer Interaction |
| 8 Informatics: Biomedical or Other Science | 8 Robotics / Vision |
| 9 Networks | 9 Security/Information Assurance |
| 10 Social Computing / Social Informatics | 10 High-Performance Computing |

In 2014, CERP asked 1,035 Ph.D. students ( 378 women; 657 men) to report their specialty area for their graduate research. Students were able to select more than one specialty area. Although there was considerable overlap in women and men's specialty areas, there were also notable differences. In particular, women were more likely to specialize in human-oriented research areas such as Human-Computer Interaction, Biomedical Informatics and Social Computing/Informatics. This pattern is consistent with social science research indicating that, on average, women tend to be more interested in professions with clear social applications compared to men. CERP's data suggest that one way to increase women's participation in computing research is to promote women's understanding of the social applicability of computing research early on. To accomplish this, academics and industry members could give research talks to K-12 and college students with emphasis on the real world implications of their research.

This infographic is brought to you by the CRA's Center for Evaluating the Research Pipeline (CERP). CERP provides social science research and comparative evaluation for the computing community. To learn more about CERP, visit our website at http://cra.org/cerp/.

## CCC Announces New Council Members

The Computing Research Association (CRA), in consultation with the National Science Foundation (NSF), has appointed five new members to the Computing Community Consortium (CCC) Council:

- Cynthia Dwork, Microsoft Research
- Kevin Fu, University of Michigan
- Daniel P. Lopresti, Lehigh University
- Shwetak Patel, University of Washington
- Katherine Yelick, University of California at Berkeley

Beginning July 1, the new members will each serve three-year terms. The CCC Council is comprised of 20 members who have expertise in diverse areas of computing. They are instrumental in leading CCC's visioning programs, which help create and enable visions for future computing research. Members serve staggered three-year terms that rotate every July.

The CCC, CRA and NSF thank those Council members whose terms end on June 30 for their exceptional dedication and service to the CCC and to the broader computing research community:

- Susan Davidson, University of Pennsylvania
- Susan Graham, University of California at Berkeley, founding member of CCC
- Joseph Evans, The University of Kansas
- Ran Libeskind-Hadas, Harvey Mudd College, founding member of CCC
- Shashi Shekhar, University of Minnesota
- Robert Sproull, Oracle Corporation

The CCC encourages participation from all members of the computing research community. Each fall, the CCC issues a call for proposals for visioning activities. Each spring, the CCC issues a call for nominations for Council members effective the following July. For more information, please visit the CCC website or contact Dr. Ann W. Drobnis, CCC Director, at adrobnis@cra.org.

## Full Bios of New CCC Council Members

## Cynthia Dwork

Cynthia Dwork is known for her research placing privacy-preserving data analysis on a mathematically rigorous foundation, including the co-invention of differential privacy, a strong privacy guarantee frequently permitting highly accurate data analysis. She was elected as a Fellow of the American Academy of Arts and Sciences (AAAS) in 2008, as a member of the National Academy of Engineering in 2008, and as a member of the National Academy of Sciences in 2014. She received the Dijkstra Prize in 2007 for her work on consensus problems together with Nancy Lynch and Larry Stockmeyer. Dwork received her B.S.E. from Princeton University in 1979, graduating Cum Laude, and receiving the Charles Ira Young Award for Excellence in Independent Research. Dwork received her Ph.D. from Cornell University in 1983. For additional information visit: http://research.microsoft. com/en-us/people/dwork/.

## Kevin Fu

Kevin Fu is Associate Professor of Electrical Engineering and Computer Science at the University of Michigan where he directs the Archimedes Center for Medical Device Security and the Security and Privacy Research Group. His research investigates how to achieve trustworthy computing on embedded devices with application to health care, commerce, and communication. His participation in the provocative 2008 research paper analyzing the security of a pacemaker/defibrillator led to a watershed moment in cybersecurity for medical device manufacturing and regulatory science. Prof. Fu received his Ph.D. in EECS from MIT where his doctoral research pertained to secure storage and web authentication. Fu received a Sloan Research Fellowship, NSF CAREER award, Fed100 Award, and best paper awards from various academic silos of computing. The research is featured in critical articles by the NYT, WSJ,
and NPR. Kevin was named MIT Technology Review TR35 Innovator of the Year for work on medical device security. Kevin has testified in Congress on health matters and has written commissioned work for the Institute of Medicine of the National Academies. He served as a visiting scientist at the Food \& Drug Administration, the Beth Israel Deaconess Medical Center of Harvard Medical School, Microsoft Research, and MIT CSAIL. Previous employers include Bellcore, Cisco Systems, HP Labs, and Holland Community Hospital. He is a member of the ACM Committee on Computers and Public Policy and the NIST Information Security and Privacy Advisory Board. He is a principal investigator of Trustworthy Health \& Wellness. Prior to joining Michigan, he served on the faculty at UMass Amherst. Kevin also holds a certificate of achievement in artisanal bread making from the French Culinary Institute. For more information visit: https://web.eecs.umich. edu/~kevinfu/.

## Daniel P. Lopresti

Daniel Lopresti received his bachelor's degree from Dartmouth in 1982 and his Ph.D. in computer science from Princeton in 1987. After completing his doctorate, he joined the Department of Computer Science at Brown and taught courses ranging from VLSI design to computational aspects of molecular biology and conducted research in parallel computing and VLSI CAD. He went on to help found the Matsushita Information Technology Laboratory in Princeton, and later also served on the research staff at Bell Labs where his work turned to document analysis, handwriting recognition, and biometric security.

In 2003, Dr. Lopresti joined the Department of Computer Science and Engineering at Lehigh where his research examines fundamental algorithmic and systems-related questions in pattern recognition, bioinformatics, and security. Dr. Lopresti is director of the Lehigh Pattern Recognition Research (PatRec) Lab. On July 1, 2009, he became Chair of the Department of Computer Science and Engineering. Effective July 1, 2014, he assumed the role of Interim Dean of the P. C. Rossin College of Engineering and Applied Science at Lehigh. For additional information visit: http://www.cse.lehigh. edu/~lopresti/.

## Shwetak Patel

Shwetak N. Patel is the Washington Research Foundation Entrepreneurship Endowed Professor in Computer Science and Engineering and Electrical Engineering at the University of Washington, where he directs his research group, the Ubicomp Lab. His research interests are in the areas of Human-Computer Interaction, Ubiquitous Computing, Sensor-enabled Embedded Systems, and User Interface Software and Technology. He is particularly interested in developing new sensing technologies with a particular emphasis on energy monitoring and health applications for the home.

Dr. Patel was a founder of Zensi, Inc., a residential energy monitoring company, which was acquired by Belkin, Inc in 2010. He is also a co-founder of SNUPI Technologies, a lowpower wireless sensor company. He received his Ph.D. in Computer Science from the Georgia Institute of Technology in 2008 and B.S. in Computer Science in 2003. Dr. Patel is a recipient of a MacArthur Fellowship (2011), Microsoft Research Faculty Fellowship (2011), Sloan Fellowship (2012), TR-35 Award (2009), World Economic Forum Young Global Scientist Award (2013), and an NSF Career Award (2013). He was also named top innovator of the year by Seattle Business Magazine and Newsmaker of the year by Seattle Business Journal in 2011. His past work was also honored by the New York Times as a top technology of the year in 2005. For more information visit: http://abstract.cs.washington.edu/~shwetak/.

## Katherine Yelick

Katherine Yelick is a Professor of Electrical Engineering and Computer Sciences at the University of California at Berkeley and is also the Associate Laboratory Director for Computing Sciences at Lawrence Berkeley National Laboratory. She is the co-author of two books and more than 100 refereed technical papers on parallel languages, compilers, algorithms, libraries, architecture, and storage. She co-invented the UPC and Titanium languages and demonstrated their applicability across architectures through the use of novel runtime and compilation methods. She also
co-developed techniques for self-tuning numerical libraries, including the first self-tuned library for sparse matrix kernels which automatically adapts the code to properties of the matrix structure and machine. Her work includes performance analysis and modeling as well as optimization techniques for memory hierarchies, multicore processors, communication libraries, and processor accelerators. She has worked with interdisciplinary teams on application scaling, and her own applications work includes parallelization of a model for blood flow in the heart. She earned her Ph.D. in Electrical

Engineering and Computer Science from MIT and has been a professor of Electrical Engineering and Computer Sciences at UC Berkeley since 1991 with a joint research appointment at Berkeley Lab since 1996. She has received multiple research and teaching awards and is a member of the California Council on Science and Technology and a member of the National Academies committee on Sustaining Growth in Computing Performance. For more information visit: http:// www.cs.berkeley.edu/~yelick/.

## Great Innovative Ideas!

The Computing Community Consortium (CCC) is delighted to announce a new feature on our website!

# NSF's CISE Pushing beyond Today's Internet 

By Erwin Gianchandani \& Gera Jochum, Directorate for Computer and Information Science and Engineering, National Science Foundation

In late March, NSF's Directorate for Computer and Information Science and Engineering (CISE) sponsored a meeting, "Beyond Today's Internet: Experiencing a Smarter Future," which brought together researchers, educators, entrepreneurs, and civic leaders who are envisioning the future of the Internet through the Global Environment for Network Innovations, or GENI, Project and US Ignite Initiative. The joint session began with remarks by NSF Director Dr. France Córdova and White House Office of Science and Technology Policy Deputy Director for Technology and Innovation Tom Kalil, followed by demonstrations of what this future might entail, as detailed in a blog by Steve Lohr of the New York Times. NSF published a new special report with links to a press release, discovery stories, and videos that demonstrate the efforts of these communities, and CISE published a new perspective, which is reprinted below:

## Beyond today's Internet: Experiencing a smart and connected future

A perspective from Erwin Gianchandani, Deputy Division Director for Computer and Network Systems

Nearly 30 years ago, NSF initiated NSFNET, a general-purpose research network that sought to link scientists and engineers to the nation's supercomputing facilities. Through additional public funding and private industry partnerships, NSFNET led to breakthrough discoveries in network architectures, protocols, and applications - that in turn ultimately developed into a major part of the backbone of today's Internet.

Along with the Internet came essential and fundamental advances in networking and information technology that have transformed our world - from sensor networks to real-time data analytics to mobile and ubiquitous computing. Today, we all carry smartphones and tablets. We communicate with one another via emails transmitted over the Internet. And "Google" - which traces its origins back to NSF funding of a Stanford
digital library project in the 1990s - is a verb and has grown into a multi-billion-dollar corporation.

Taken together, our fundamental research advances over the last several decades have accelerated the pace of discovery in nearly all fields - and they have enabled us to achieve national priorities and advance economic competitiveness.

But we haven't stopped innovating the Internet despite these advances. NSF's Directorate for Computer and Information Science and Engineering (CISE) has led long-term, significant investments in the Global Environment for Network Innovations, or GENI Project, and the US Ignite initiative. By investing in future networking architectures, protocols, and applications, and by helping to nurture and grow communities of researchers, experimenters, and developers, NSF continues to advance the capabilities and user experiences afforded by the Internet for generations to come.

## A Global Environment for Network Innovations

Since its inception in 2007, NSF's investments in GENI have allowed us to build an at-scale virtual laboratory for networking experimentation. Today, GENI spans over 60 university campuses throughout the U.S. as well as collaborators in over 30 countries around the world. GENI has resulted in two key networking innovations:

1. First, it enables individual researchers to obtain access to their own secure "slice" of the network to conduct experiments.
2. And second, it allows for control of the network to be separate from the data flowing through it, enabling researchers and developers to customize experiments and applications, and to try radically new approaches for realtime, secure, enhanced, and personalized user experiences.

To date, more than 3,500 researchers around the globe have used GENI to conduct networking and other scientific experiments in ways that are simply not possible on today's
production Internet. And over 100,000 unique customizations have been created.

The innovations enabled by GENI - slicing and deep programmability - have also led to a new paradigm called Software-Defined Networking (SDN). Through partnerships with leading networking companies, SDN has become a multi-billion-dollar sector in just a matter of years - and it is anticipated to top \$35 billion in market value by the year 2018.

## Advancing Next-Generation Public-Sector Application Prototypes

To leverage our investments in GENI and take advantage of this programmable virtual laboratory, NSF, in collaboration with other federal, state, and local governments and industry partners, launched the US Ignite initiative in 2012.

US Ignite is connecting "islands" of broadband across the nation and demonstrating the potential of game-changing new applications that take advantage of ultra-high speed connections. These "apps" are offering new ways to provide never-before-imagined services that are in turn beginning to transform public safety, healthcare, education and learning, energy, transportation, manufacturing, and more.

Showcasing the potential of these next-generation applications, especially in addressing societal challenges, has proven that access to ultra-high-speed network connections is critically important for our future. It has also begun to demonstrate how a novel approach - a "user-inspired" model for advancing gigabit networks - is having an impact. For too long, there has been a fundamental deadlock: there has been insufficient investment in gigabit applications that can take advantage of advanced networking infrastructure because such infrastructure is rare and dispersed; and conversely, there has been a lack of broad availability of advanced broadband infrastructure for open experimentation and innovation because there are few advanced applications and services to justify it. We are breaking this deadlock by inspiring users themselves - through imagining, prototyping, and developing public-sector gigabit applications, and leveraging and extending a network testbed across U.S. campuses, cities, and regions.

In fact, since US Ignite's launch three years ago, we have seen nearly 40 cities and regions across the nation deploy
gigabit connections to homes and businesses - and over 100 concepts or prototypes of applications that use these advanced networks have emerged. One app has resulted in operational improvements in emergency response following disasters. Another has catalyzed a small business with a commercial product called FitNet that analyzes high-quality video of individuals' exercise routines to provide personalized and real-time feedback to improve their health.

## Toward a Smart and Connected Future

The result is that secure, programmable networks and next-generation apps are making their way into schools, libraries, hospitals and homes in communities across the nation. Through the hard work of researchers, educators, entrepreneurs, and civic leaders alike, these technologies are giving rise to transformational approaches for conducting science and engineering broadly - and they are fostering game-changing innovation throughout the entire Internet ecosystem.

NSF continues to facilitate the involvement of citizens and community organizations in building and experimenting with multiple advanced networking applications addressing national priorities. We are especially interested in fostering efforts that support mechanisms and processes to rapidly share and scale up innovations by transferring applications shown to be useful in once city/region to other cities/regions. Ultimately, a key goal is to support mechanisms that will enable cities and regions to develop a smart and connected national ecosystem supporting applications of advanced networking.

# Computing Education Research Becomes a Research Area in CISE's CAREER Proposals: What every department should know about CS Education research 

Susanne Hambrusch, Purdue University<br>Mark Guzdial, Georgia Institute of Technology

#### Abstract

The 2014 NSF CAREER competition in the Computer and Information Sciences and Engineering (CISE) directorate for the first time actively sought proposals in computing education research. The area of interest was closely aligned with the computing education research goals stated in its CE21 solicitation (NSF 12-609) which solicited proposals developing a research base for computing education: "Projects may conduct basic research on the teaching and learning of computational competencies in face-to-face or online settings; they may design, develop, test, validate, and refine materials, measurement tools, and methods for teaching in specific contexts; and/or they may implement promising small-scale interventions in order to study their efficacy with particular groups." In March 2015 CISE announced two education research CAREER awardees, Kristy Boyer and R. Benjamin Shapiro. In the coming CAREER cycle, CISE is again inviting computing education research proposals. The topics of interest are highlighted in the STEM + C solicitation (NSF 15-537). Of special interest for CAREER proposals is the track focused on Computing Education Knowledge and Capacity Building.

This article briefly describes the proposed research in the two new CAREER awards. These two awards represent a new area of exploration for CISE. Computing education research offers new opportunities for computer science departments and schools, and we also describe some of them.

Kristy Elizabeth Boyer is an Assistant Professor of Computer Science at North Carolina State University. Her research focuses on how to support learning with natural language dialogue and intelligent systems. Her interest in computer science education research focuses on collaborative learning and on how machine learning can help us understand social, cognitive, and affective phenomena in human interactions. She received a Ph.D. in Computer Science from North Carolina State University in 2010. She holds an undergraduate degree in Mathematics and Computer Science from Valdosta State University and an M.S. in Applied Statistics from the Georgia Institute of Technology. Kristy was the recipient of a 2007 NSF Graduate Research Fellowship award.

Kristy Boyer's CAREER project is titled "CS-CLIMATE: Collaborative Learning for Identity, Motivation, and Technology Engagement." A rich body of evidence suggests that collaborative learning holds many benefits for computer science students, yet there is growing recognition that neither collaborative learning itself, nor the innovative curricula in which it may be situated, are "magic bullets"
capable of single-handedly broadening the participation of students belonging to underrepresented groups. In contrast to being a one-size-fits-all solution, collaborative learning is highly dependent upon characteristics of the collaborators and on fine-grained interactions.

The proposed research will explore the fine-grained facets of collaborative dialogue known to be particularly effective for diverse computer science learners and build theoretically informed models that capture collaborative dialogue and problem solving phenomena associated with learning, identity development, motivation, and engagement. The project will leverage a learning environment built by the PI to support remote collaboration with textual natural language dialogue, synchronized code editing, and integrated repository control. It will implement and evaluate evidence-based pedagogical support for fostering effective collaborative dialogue by extracting a set of evidence-based pedagogical strategies for fostering effective collaborative dialogue tailored to student characteristics. Pedagogical support is expected to significantly improve learning, sense of identity, motivation,
and continued engagement for students overall, and for women and African American students in particular. The research will draw upon collaborative learning data from computer science students at North Carolina State University, Meredith College, and Florida A\&M University.

Benjamin Shapiro is the McDonnell Family Assistant Professor of Engineering Education and an Assistant Professor in the departments of Computer Science and Education at Tufts University. He received his Ph.D. in Learning Sciences from Northwestern University in 2009 and was a postdoctoral fellow at the University of Wisconsin-Madison. He holds an undergraduate degree in Independent Studies in Symbolic Systems (Computer Science \& Cognitive Science) from the University of California, San Diego. His research focuses on the design of playful and constructionist learning environments. He studies how engineering computational systems can help learners to further their personal interests. To do so, he creates new technologies for learning and investigates how people, including students and teachers, use them to learn together.

Ben Shapiro's CAREER project is titled "Constructing Modern and Inclusive Trajectories for Computer Science Learning." His research will explore how youth building distributed cyber-physical systems offers possibilities of broadening participation and producing new theoretical and practical insights into the development of computational thinking.

Using data from middle and high school students solving problems by building networks of devices and mobile applications that communicate with each other, the project will develop new empirically-supported theories of the development of student thinking about distributed computing, as well as new tools to enable that development. Underrepresented minority youth will be partners in the codesign of the tools and supporting curriculum and the effects of their participation on interest, self-efficacy, and projective identity within computer science will be evaluated. A learning environment will be constructed to support youths' transitions from using beginner-specific programming environments (e.g., Scratch) into techniques and tools that are commonly found in university-level computer science education and in industry and open-source community practice. The research will describe and assess the development of student thinking in these transitions.

Benjamin Shapiro and Kristy Boyer at the Computing Education for the 21st Century NSF PI Meeting.

## Why computing education research is important to

 computer science. Undergraduate enrollments are at a record high level. University administrators are unsure whether this is another high in the CS enrollment cycle to be followed by a steep drop or whether this is the new status quo. A time of burgeoning enrollments may not seem like an obvious time to focus on research in computing education, but the reality is that computer science students are changing and computing education practices are needed. Increased class sizes make many faculty re-evaluate how to teach and how to assess learning at scale. While MOOCS courses had significant promise three years ago, completion rates have been disappointing. But MOOCS demonstrated a new approach and model for a scalable teaching method that could make novel use of continuously collected data on learning.Faculty are teaching freshmen with increasingly diverse computing backgrounds, both in-person and in-MOOCs. We see an increasing number of non-majors are taking computing courses. We do not always know how to engage, motivate, and retain a diverse student body. We know surprisingly little about how students understand foundational concepts in computer science. We know even less about effective methods for teaching parallel and distributed computing concepts. The field of computing education research draws on other disciplinary-based education research (DBER) areas, like science, mathematics, and engineering education. The
history of DBER fields tell us computer science education is different, with unique challenges.

The percentage of students from underrepresented groups in computing has changed little in the last decade. While many departments have outreach and recruiting events that manage to attract more students from underrepresented groups, the retention of those students is often a challenge. To engage more diverse students, departmental outreach activities increasingly engage the entire K-12 range. However, little is known about validated practices for the earlier ages.

The computing community has recently seen a number of new activities at the high school level. A new AP course called CS Principles has been developed in an NSF-funded effort between computer scientists, higher education and high school educators, and the College Board. The CS Principles course is currently piloted in hundreds of schools across the country. The course will "introduce students to creative aspects of programming, using abstractions and algorithms, working with large data sets, understandings of the Internet and issues of cybersecurity, and impacts of computing that affect different populations." The course was designed to be engaging and inspiring for all students. With only $19 \%$ of high school students currently taking a single CS course, the CS Principles course aims to attract a more diverse student to computing. The first AP Computer Science Principles Exam is taking place in May 2017.

Computer science has the unique position of teaching the medium that we can also use to teach. Can computing revolutionize how we teach and how students learn computer science? We can create specialized development environments tuned to the learning needs of our students. As we teach with MOOCs and other new media, we are challenged to explore the advantages of these platforms. Are there effective and scalable methods available to instructors for automated assessment of learning? Do we have validated data and evidence driven analysis tools for student learning? Many of these questions are at the heart of computing education research.

The research proposed by the two exceptional CS education researchers in their CAREER awards highlights a number of characteristics of computing education research. First, the field of computing education research is interdisciplinary.

While grounded in computer science, the research area draws expertise and knowledge from learning sciences, education research, behavior and social scientists, psychology and sociology. We expect successful researchers to have a strong background in computer science as well as a clear understanding of the techniques and tools of education and learning science research. Many promising computing education research projects explore the application of the methods used in computer science research on itself. Common are methods in the areas of machine learning, big data/analytics, delivery of software as a service, human computer interaction. Computing education research has a number of similarities with HCl research. HCl research relies on the computing discipline to develop new methods and techniques and it also uses methods from the social sciences for assessment and validation.

Computing education research topics include understanding how students with different backgrounds learn computing, understanding how to effectively teach computing to audiences with different interests and backgrounds, and how to make use of personalized learning approaches and validated learning progressions. Research focuses on inventing, developing, assessing and validating ways to teach computing at all levels, from elementary school to a scientist. Computing education research aims to transform how learning happens in the traditional classroom as well as on-line. Based on new understandings on how learning happens, new systems and tools supporting teaching at scale are developed and assessed. Computing education research also includes effective teacher preparation and training, both as pre-service and in-service.

Numerous funding opportunities for computing education research exist. At NSF, the CISE and the EHR directorates both offer solicitations that can support work in computing education research. The most recent STEM + Computing Partnerships (STEM + C) solicitation is such an example. Other opportunities include Science of Learning (NSF 15-532), Cultivating Cultures for Ethical STEM (CCE STEM, NSF 15-528), and Cyberlearning and Future Learning Technologies (NSF 14-526). The Department of Education is also a source for computing education research funding. Funding opportunities from foundations include the MacArthur Foundation, Gates Foundation, and Sloan Foundation. Companies with a critical
workforce computing needs including Microsoft Research, Google, Intel, IBM have various programs and opportunities for support.

In the long run, computing education research will strengthen our field and it has the potential to broaden participation of underrepresented groups. Understanding how students think about computing and how we can improve their learning will have impacts in how we design the interface between humans and computers. Teachers will have access to validated and established pedagogical instruments and assessment tools. The training of K-12 computer science teachers will follow established guidelines, principles, and methods. Departments with faculty interested in computing education research or interested in hiring in this area, will realize that a number of models for successful appointments and collaborations exist. Faculty often have joint
appointments, especially in CS departments that are not in a College/School of Computing environment. Departments with computing education research as focus will train graduate students in the field of computing education research and will develop curricula. We expect graduates to get hired by CS/II CE departments with active computing education research, Education departments, teaching focused institutions, providers of on-line and MOOCS courses, high schools, and organizations like Code.org, the Computer Science Teachers Association (CSTA), the National Center for Women in Information Technology (NCWIT), or Project Lead the Way (PLTW). This is an exciting time to get involved in computing education research, a research area shaped by the advances in our field which will help shape the future of our field.

## Announcements

## The CRA 2013-14 Annual Report is Now Available!

Find out about the impacts of CRA's activities in our mission areas of leadership, policy and talent development.
fry Click here to download our Annual Report.

## Achievements

Current CRA Board Member Laura Haas was elected a Fellow of the American Academy of Arts and Sciences.

Current CRA Board Member Margaret R. Martonosi was selected to receive the Marie R. Pistilli Women in EDA Achievement Award.

Former CRA Board Members Bob Kahn and Moshe Vardi were recently elected to the National Academy of Sciences in recognition of their distinguished and continuing achievements in original research.

Former CRA Board Member Jeanette Wing is the 2015 ACM Service Award Recipient.

## Dear Colleague Letter: ACI \& Career

Dear Colleague:

The Directorate for Computer and Information Science and Engineering (CISE) Division of Advanced Cyberinfrastructure (ACI) invites proposals from junior faculty within the community of scientists, engineers, and educators involved with cyberinfrastructure research to apply to the Faculty Early Career Development (CAREER) Program (http:// www.nsf.gov/career). ACl's research interests include useinspired and/or applied multidisciplinary research. Additional context for ACl's interests in this solicitation can be found in "Cyberinfrastructure Framework for 21st Century Science and Engineering (CIF21)" at http://www.nsf.gov/cif21. These proposals are due this year on July 21, 2015 and next year on July 20, 2016.

CAREER is a Foundation-wide activity that offers the National Science Foundation's (NSF) most prestigious awards in support of junior faculty who exemplify the role of teacherscholars through outstanding research, excellent education and the integration of education and research within the context of the mission of their organizations. Such activities should build a firm foundation for a lifetime of leadership in integrating education and research. NSF encourages submission of CAREER proposals from junior faculty members at all CAREER-eligible organizations and especially encourages women, members of underrepresented minority groups, and persons with disabilities to apply.

Within this context, ACl encourages proposals that are either of:

1. primary interest to ACl , or
2. primary interest to another division of NSF, and of secondary interest to ACl .

In both cases, to be of interest to ACI, proposals should promote research, education, and the integration of research and education in projects that:

1. Contribute to exploration, experimentation, development, and/or deployment of comprehensive, integrated, sustainable, and secure cyberinfrastructure at the campus, regional, national, and/or international scale,
2. Have an effective cyberinfrastructure impact with clearly defined benefits across multiple research disciplines, and
3. Build on or complement the existing or upcoming ACl investments, as well as major cyberinfrastructure investments from other NSF divisions.

CAREER proposals that seek ACI support should clearly address these issues within the body of the proposal, and should designate ACI as the primary or secondary program during proposal submission.

Many general questions are answered in the program's FAQ document, which is available from the CAREER program page (http://www.nsf.gov/career). The FAQ question \#34 relates to ACI (http://www.nsf.gov/pubs/2015/nsf15057/nsf15057. jsp\#b34).

ACl-specific questions regarding the solicitation should be addressed to Sushil Prasad, sprasad@nsf.gov.

Sincerely,
James Kurose,
Assistant Director, CISE

Margo Seltzer, Harvard University
Ellen Zegura, Georgia Institute of Technology

## CRA Board Officers

J Strother Moore, Chair, The University of Texas at Austin Laura Haas, Vice-Chair, IBM Research - Almaden
Ronald Brachman, Treasurer, Yahoo Labs
Susan B. Davidson, Secretary, University of Pennsylvania

## CRA Staff

Andrew Bernat, Executive Director
Betsy Bizot, Director of Statistics and Evaluation
Melissa Borts, CRA Program Associate
Sandra Corbett, Program Associate
Ann Drobnis, Director, Computing Community Consortium
Peter Harsha, Director of Government Affairs
Sabrina Jacob, Administrator
Ama Nyame-Mensah, Research Associate, Center for
Evaluating the Research Pipeline
Brian Mosley, Policy Analyst
Erik Russell, Director of Programs
Shar Steed, Communications Specialist
Jane Stout, Director, Center for Evaluating the
Research Pipeline
Heather Wright, Research Associate, Center for Evaluating the Research Pipeline
Helen Wright, Program Associate, Computing Community Consortium

## Column Editor

Expanding the Pipeline Patty Lopez, Intel

## Professional Opportunities

## AT\&T Labs

Researchers and Research Engineers
AT\&T Labs, one of the world's premier R\&D Labs, is looking for passionate, talented and inventive scientists and engineers to join our team full-time. Of particular interest are candidates with backgrounds in the areas of cloud computing, virtualization, software defined networking (SDN), Network Function Virtualization (NFV), Network Virtualization (NV), mobile computing, service quality management, optimization, machine and online learning, big data and largescale distributed computing, stream data management, data quality, visualization, and large-volume stream analytics systems. Specific expertise of interest includes, but is not limited to, the following:

- Big Data and Data Science Research: Massive data analytics; machine learning and statistical computing; data visualization; database management; data quality and streaming data systems
- Cloud Technologies \& Services Research: Compute, storage, network virtualization; Distributed storage, databases; Cloud Quality of Service (QoS) methods; Resource scheduling, placement, optimization; hypervisors; security
- Intelligent Services and Platform Research: intelligent systems, machine learning and autonomous technologies for driving enterprise, IoT and mobility services
- Networking and Service Quality Management (SQM) Research: SQM for cloud-based services and beyond; Crosslayer analytics and design in a mobile, virtualized and SDN-controlled world
- Optimization for Network and Virtualized Services: Optimization, reliability, network analytics, statistics, and analytics prototyping for SDN-controlled virtualized networks

## our Culture

AT\&T Labs draws on a rich heritage of innovation, including eight Nobel Prizes, and a strong culture that encourages openness, teamwork, and collaboration across AT\&T, academia and within the industry.

## How to Apply

Interested in a career with AT\&T Labs?
To apply, visit http://soc.att.com/ljrmLH9 for positions in each of these areas.

## Boise State University

Department of Computer Science Tenure-Track Faculty Position (Assistant/ Associate/Full Professor)

The Department of Computer Science at Boise State University invites applications for an open-rank, tenured/tenure-track position at the assistant, associate or full professor level. Applicants should have a commitment to excellence in teaching, a desire to make significant contributions in research, and experience in collaborating with faculty and local industry to develop and sustain funded research programs. Seeking an applicant with systems background, including but not limited to, operating systems, programming languages, compilers, computer architecture or high performance computing. Preference given to candidates with experience collaborating in the following areas: big data, information retrieval, security, machine learning or visualization. A Ph.D. in Computer Science or a closely related field is required by the date of hire.

The University and the State of Idaho have made significant investments in the department to satisfy the high demand for computer science graduates, driven by the vibrant software and high-tech industry of the Boise metropolitan area. The department has undergone a major expansion in the last two years with four new faculty and three new lecturers, additional office staff, sixteen
new graduate and teaching assistant lines, a spacious tutoring center for computer science and substantially increased budget. A PhD program is currently under development.

For application and other information, please visit: http://coen.boisestate.edu/cs/jobs
Boise State University is strongly committed to achieving excellence through cultural diversity. The University actively encourages applications and nominations of women, persons of color, and members of other underrepresented groups. EEO/AA Institution, Veterans preference may be applicable.

## Clemson University

## School of Computing

## 12-month Senior Lecturer Position

The School of Computing at Clemson University invites applicants for a 12-month Senior Lecturer position, in the role of undergraduate coordinator. The coordinator will oversee advising, orientation, student records, and scholarships, serve as the lead on assessment and accreditation activities, and serve as the point of contact for career placement and outreach. The coordinator will also teach one course per semester, typically an undergraduate course, but with the opportunity to teach a graduate-level course in the candidate's area of specialty.

Clemson University is an Affirmative Action/ Equal Opportunity employer and does not discriminate against any individual or group of individuals on the basis of age, color, disability, gender, national origin, race, religion, sexual orientation, veteran status or genetic information.

For more information and to apply, please visit: http://www.clemson.edu/ces/ computing/cs-lecturer-position.html

## Professional Opportunities

## D-Wave Systems <br> Machine Learning Researcher

D-Wave Systems is looking for experienced machine learning researchers to develop algorithms to exploit our unique adiabatic quantum computer.

To for more information and to apply visit http://www.dwavesys.com/careers/machine-learning-researcher

## The Henry M. Jackson Foundation

Junior and Senior Scientists
The Henry M. Jackson Foundation (HJF) is looking for junior and senior scientists to join the U.S. Army Medical Research and Materiel Command's Biotechnology High Performance Computing Software Applications Institute (BHSAI) [www.BHSAI. org]. HJF provides scientific, technical, and programmatic support services to the BHSAI. This opening is for dynamic scientists interested in working in an interdisciplinary environment focused on the development and the application of computational solutions to biomedical problems, involving signal processing of time series physiological data, data mining, datadriven and physiological-based models, and artificial intelligence. The candidate should have a Ph.D. in a related discipline and a strong publication record. The candidate is expected to simultaneously work on multiple projects, involving a diverse and interdisciplinary team of scientists across multiple laboratories.

Foreign nationals are welcome to apply. U.S. citizenship or permanent resident status is not required. This position is located in Frederick, Maryland.

Please apply on-line at careers.hjf.org click "Advanced Search" and enter job number
$\underline{208839}$ in the Job Opening ID box.

## HJF is an equal opportunity and affirmative action employer. All qualified applicants will receive consideration for employment without regard to race, color, religion, sex, sexual orientation, gender identity, national origin, disability, or protected veteran status.

## Istanbul Sehır Unıversity

Computer Engineering
Assistant Professor
Istanbul Sehir University (SEHIR), Turkey, invites all applications for a full-time position in Computer Science Department. The position is available at the Assistant Professor rank beginning in September 2015.

The areas of particular interest are: Software Engineering, Information and Data Management, Scalable Data Science, High Performance Distributed Computing, Cloud Computing, Information Retrieval, and Health Informatics.

All candidates are expected to have a Ph.D. degree in COMPUTER SCIENCE from a major research university, prior to, or at the time of, appointment. The successful candidate is expected to have excellent command of English, fulfil the departmental requirements with regard to teaching (2 courses per semester), research, and service to our institution.

SEHIR is a private institution governed by the Foundation for Sciences and Arts. The foundation was established in 1986 in the city of Istanbul, Turkey. Building on a quarter-century of experience in education, SEHIR aims to be an elite research university in the whole region. The medium of instruction is English. The main campus area will be located on the shores of the Marmara Sea, overlooking Princess Islands. To be constructed at the heart of Istanbul, it will be one of the most beautiful campuses in the region.

## Professional Opportunities

Applicants should send a cover letter, curriculum vitae, undergraduate and graduate transcripts (unofficial copies initially acceptable), statement of teaching philosophy, description of research, and three letters of recommendation to: cssearch@ltu.edu (Email submission only) Computer Science Search Committee, Department of Mathematics and Computer Science
Lawrence Technological University, 21000 West Ten Mile Road,
Southfield, MI 48075-1058.
For more information:
Email mcschair@ltu.edu
Web site: http://www.Itu.edu/arts_sciences/ mathematics_computer_science/index.asp

Lawrence Tech is an independent university enrolling approx. 5000 students and surrounded by many of the Midwest's premier high-tech corporations. LTU's technological focus coupled with strong programs in engineering, architecture, business, and the sciences provides unique opportunities for collaboration across colleges and disciplines.

EOE, strongly encouraging applications from females and minorities.

## NEC Laboratories America, Inc.

 Researcher - Data ManagementThe Data Management Department of NEC Laboratories America, Inc. in Cupertino, CA is focused on building large-scale data management platforms to solve real problems and expand NEC's business offerings. Our research has directly contributed to NEC products/solutions and also has resulted in publications at top-tier conferences, including a record 5 accepted research papers in SIGMOD 2014.

Our focus in the big data analytics space is in providing holistic support to data scientists as they perform the seemingly
endless task (http://tinyurl.com/puk25m2) of data preparation and modeling in the process of finding value in data. To this end, our group is developing a suite of big data solutions that frees up data scientists from data engineering concerns so that they can simply focus on the analysis. We have two areas for targeted hiring:

1. Development of large-scale big data analytical systems with focus on query optimization, physical design tuning and management of analytics on multiple stores such as Hadoop, Spark, DW, and Graph Databases etc.
2. Design of data management systems to support extremely large-scale machine learning tasks with focus on providing support for model building, testing and validation.

Suitable candidates must have a Ph.D. degree (or equivalent) in Computer Science (or related fields) with strong research results and excellent hands-on system development skills. Good knowledge of database internals and existing big data technologies is a must. Familiarity with machine learning algorithms and data science is very desirable. Contributions to open source software will be considered a plus.

For more information about NEC labs, access http://www.nec-labs.com/, and submit your CV and research statement through our career center at https://www. appone.com/MainInfoReq.asp?R_ID=1033864.

EOE-M/F/Vets/Disabled

## NEC Laboratories America

Researcher - Mobile Communications and Networking

The Mobile Communications and Networking research department at NEC Laboratories
America in Princeton, NJ, has Researcher positions available. In addition to current areas of research, the department is evolving

## Professional Opportunities

2. Networking systems experience at the application and services layer. Background in technologies including but not limited to traffic optimization, software-defined networking and cloud services is desirable with an emphasis on application of such technologies on application of such technologies
to developing end-to-end wireless networking solutions.

Candidates must have, or soon expect to receive, a PhD degree in EE or CS and have receive, a PhD degree in EE or CS and have
strong research experience and publication record. Candidates must be able to carry out original research, develop innovative technologies, work towards technology
in new directions with specific focus on developing end-to-end wireless networking solutions. Details about projects can be found at http://www.nec-labs.com/research-departments/mobile-communications/mobile-communications-home

The current search is for candidates with the following experience:

1. Experience in novel technology development at the MAC and TCP/ IP layers of the protocol stack and developing prototypes using software radios and other research oriented wireless platforms. Familiarity with basic PHY concepts is a plus.
transfer to relevant business units within the company, and also maintain a track record of high-quality peer-reviewed publications.

Interviews for select candidates will be scheduled during the first three weeks of April with decisions expected to be made by the end of April.

For more information about NEC labs, access http://www.nec-labs.com/, and submit your CV and research statement through our career center at https://www. appone.com/MainInfoReq.asp?R_ID=1022879.

# CMERicentich 

Michigan Technological University Department of Computer Science Lecturer Position

Applications are invited for a Lecturer position beginning August 2015 with a teaching focus of second and third-year systems courses. Appointed for two-year renewable terms, an applicant must have a master's or doctoral degree in Computer Science, Computer Engineering, or equivalent. The expected teaching load is three courses per semester. Review of applications will begin on May 15, 2015 and will continue until the position is filled. Women and under-represented minorities are particularly encouraged to apply.

Applications should be submitted online at www.jobs.mtu.edu/postings/2981. To learn more about the opportunity, please visit www.mtu.edu/cs/department/employment/faculty-staff/.

Michigan Tech is an ADVANCE Institution, one of a limited number of universities in receipt of NSF funds in support of our commitment to increase diversity and the participation and advancement of women in STEM. Michigan Tech acknowledges the importance of supporting dual career partners in attracting and retaining a quality workforce. See Dual Career Program for additional information.

Michigan Tech is an EOE which includes protected veterans and individuals with disabilities

## Professional Opportunities

For further consideration please email a CV to Kate Carter, ORNL Recruiter, at carterka@ ornl.gov.

## Ohio University

School of Electrical Engineering and Computer Science
Lecturer (Lecturer/Associate Lecturer/S enior Lecturer)

The School of Electrical Engineering and Computer Science in the Russ College of Engineering and Technology at Ohio University is currently inviting applications for the full-time, benefits eligible position of Lecturer (Lecturer/Associate Lecturer/Senior Lecturer) in Computer Science to begin on August 15, 2015.

Primary job responsibilities involve teaching undergraduate-level courses in Computer Science and committee or other service work. Job responsibilities may include teaching more advanced courses in Computer Science or student advising, depending on the current needs of the School.

Minimum qualifications for this position are an attained Master's or Ph.D. degree in Computer Science by time of appointment or similarly named program from a regionally accredited university.

Preferred qualifications for this position are a dedication to and demonstrated excellence in undergraduate education in Computer Science.

This position is faculty non-tenure track under Group II category.

Further details concerning the rights and responsibilities of Group II faculty at Ohio University can be found in the Faculty Handbook: http://www.ohio.edu/ facultysenate/handbook/

To apply, please complete the online application (http://www.ohiouniversityjobs. com/postings/13254) and attach the required documents. Incomplete applications or
applications submitted by other means (e.g. email) will not be reviewed.

For full consideration, please apply by June 1, 2015.

## Princeton University

Computer Science Department Part-Time or Full-Time Lecturer

The Department of Computer Science seeks applications from outstanding teachers to assist the faculty in teaching our introductory course sequence or some of our upper-level courses.

Depending on the qualifications and interests of the applicant, and needs of the department, job responsibilities will include such activities as teaching recitation sections and supervising graduate-student teaching assistants; grading problem sets and programming assignments; supervising students in the grading of problem sets and programming assignments; developing and maintaining online curricular material, classroom demonstrations, and laboratory exercises; and supervising undergraduate research projects. An advanced degree in computer science, or related field, is required (PhD preferred).

The position is renewable for l-year terms, up to six years, depending upon departmental need and satisfactory performance. To apply, please submit a cover letter, CV, and contact information for three references to (https://www.cs.princeton.edu/ general/jobs/lecturer) This position is subject to the University's background check policy.

Princeton University is an Equal Opportunity/ Affirmative Action Employer Equal Opportunity/Affirmative Action Employer and all qualified applicants will receive consideration for employment without regard to race, color, religion, sex, sexual orientation, gender identity, national origin, disability status, protected veteran status, or any other characteristic protected by law.

## Professional Opportunities

## Saint Louis University

Department Mathematics and Computer Science

One-Year Visiting Position
(Assistant/Associate)
Saint Louis University, a Catholic, Jesuit institution dedicated to education, research and healthcare, is seeking applicants for a one-year leave-replacement position in Computer Science at the rank of Assistant or Associate Professor within the Department of Mathematics and Computer Science. Ph.D. in Computer Science or related field required.

Duties, beginning in August 2015, include teaching three undergraduate courses each semester and possible supervision of undergraduate student projects.

Formal applications with cover letter and CV must be made online at http://jobs.slu. edu. Additional supporting materials must be submitted at http://mathcs.slu.edu/ oneyear, including: CV, research statement, teaching statement, and names of at least three references (including at least one who can address teaching experience).

Saint Louis University is an Affirmative Action, Equal Opportunity Employer (AA/ EEOE) and encourages nominations of and applications from women and minorities.

## Smith College

Statistical and Data Sciences
Visiting Assistant Professor of Data Science
4-year, full-time position. PhD in computer science, statistics, or related required.

Details at http://apply.interfolio.com/29381.
Review begins immediately.
EO/AA/Vet/Disability Employer.

Trinity University, San Antonio, Texas

Department of Computer Science
Postdoctoral Research Associate
Start Date: Summer or Fall 2015
Duration: 1 to 2 years
Contact: Albert Xin Jiang, Ph.D., Assistant Professor. http://www.cs.trinity.edu/~xjiang/

## Job Description:

The successful candidate will be working with Dr. Jiang on topics at the interface of artificial intelligence and game theory. You would ideally have research background on at least one of the following: computational game theory/multi-agent systems, machine learning, graphical models, and optimization. Experience with and/or willingness to do interdisciplinary research is desired.

Interested applicants may send their CV and reference letters to xjiang@trinity.edu

## University of Edinburgh, UK

School of Informatics
Professor of Cyber Security and Privacy
The University of Edinburgh is seeking a chair (full professor) in Cyber Security and Privacy, to join its School of Informatics, the top-performing Informatics and Computer Science department in the UK. The appointee will help lead our growth in security and privacy research and teaching

Specific areas of interest include applied cryptography, systems and network security, but any others will be considered. The main criteria will be demonstrated scientific excellence and leadership in research at a professorial level.

Full details: http://secpriv.inf.ed.ac.uk/chair Deadline: 1lth May, 2015

Informal approaches are welcomed before application.

## University of Nebraska at Omaha

College of Information Science \& Technology
Big Data Faculty Position in School of Interdisciplinary Informatics

The School of Interdisciplinary Informatics at the University of Nebraska at Omaha (UNO) invites applications for a tenuretrack position at the rank of Assistant Professor. The successful candidate will have completed a doctorate in computer science, information technology, or related disciplines and have a strong potential to generate external research and development grants and engage in teaching The School is particularly interested in candidates with experience in applying Big Data technologies in interdisciplinary fields like Bioinformatics, IT Innovation, and Information Assurance and Security. Candidates with expertise in large-scale data mining, statistical learning and an ability to apply such expertise towards interdisciplinary analytics applications are highly encouraged to apply

The selected faculty will be part of the college wide big data recruitment initiative including a cluster of hires across several departments with opportunities for joint and inter-disciplinary collaborations. The University and department have a strong commitment to achieving diversity among faculty and staff.

To apply for this position go to http:// www.unomaha.edu/humanresources/ employment.php Current curriculum vita, a cover letter and the names and contact information of three references must be attached to the electronic application. For more information contact Dr. Robin Gandhi Chair of Si2 Big Data Search Committee at rgandhi@unomaha.edu or phone number (402) 554-3363.

## Professional Opportunities

## University of Virginia

Department of Computer Science Postdoctoral Research Associate

The Department of Computer Science at the University of Virginia invites applicants for two Hobby postdoctoral research associate positions to contribute to research and education in data science, computational science, and other aspects of "Big Data." The Department is entering an exciting phase of significant growth, especially in areas related to these topics.

Successful applicants will become part of an exciting cross-disciplinary research group spanning traditional statistical and computer science research modes. Postdoctoral research associates will benefit from close relationships with faculty in U.Va.'s Data Science Institute, as well as the opportunity to expand their professional networks and travel to conferences and workshops. In order to give the postdoctoral associates experience that helps them prepare for faculty careers, the postdocs will be expected to teach one course per semester in an area related to data and computational sciences, and help advise an interdisciplinary group of graduate students.

Applicants must present evidence of outstanding accomplishments and promise in research, as well as evidence of ability and commitment to collaborative research. Priority will be given to applicants with strengths in one of the following areas of research (broadly defined): Machine Learning, Data/Network/Graph Mining, Information Retrieval, Natural Language Processing, or Analysis of High-Dimensional Massive Data.

The anticipated start date of these positions is July 1, 2015.

Centrally located in Virginia, Charlottesville boasts a thriving cultural life, easy access to recreational venues, and consistently ranks among the top cities in which to live and work. U.Va. is consistently ranked as a top public university as well as a Carnegie Research I university, and includes topranked medical and business schools.

## Qualifications:

Applicants must have in hand a Ph.D. in Computer Science or a related field by the hire date.

## Application Instructions:

Review of applications will begin April 6 , 2015; however, positions will remain open until filled.

To apply candidates must submit a Candidate Profile through Jobs@UVa (https://jobs.virginia.edu), search on posting number 0616111 and attach the following required documents: Cover letter, CV, research statement, teaching statement, and contact information for three references.

For all questions, contact deptchair@mail. cs.virginia.edu.

The University of Virginia is an equal opportunity and affirmative action employer committed to developing diversity in faculty and welcomes applications from women, minorities, veterans and persons with disabilities.
U.Va. is an active dual-career employer.
