## 2011 Taulbee Survey

## Continued Increase in Undergraduate CS Degree Production; Slight Rise in Doctoral Production

By Stuart Zweben and Betsy Bizot

The CRA Taulbee Survey ${ }^{1}$ is conducted annually by the Computing Research Association to document trends in student enrollment, degree production, employment of graduates, and faculty salaries in academic units in the United States and Canada that grant the Ph.D. in computer science (CS), computer engineering (CE) or information (I) ${ }^{2}$. Most of these academic units are departments, but some are colleges or schools of information or computing. In this report, we will use the term "department" to refer to the unit offering the program. This article and the accompanying figures and tables present the results from the 41st annual CRA Taulbee Survey.

Information is gathered during the fall. Responses received by January 23, 2012 are included in the analysis. The period covered by the data varies from table to table. Degree production and enrollment (Ph.D., Master's, and Bachelor's) refer to the previous academic year (2010-11). Data for new students in all categories refer to the current academic year (2011-12). Projected student production and information on faculty ty salaries are those effective January 1, 2012.

We surveyed a total of 267 Ph.D.-granting departments; 184 returned their survey forms, for a response rate of 69 percent. This is lower than last year's 74 percent, due to lower response
rates from the CS and Canadian departments (77 and 43 percent, respectively). The response rate from CE departments was 42 percent, and that from I departments was 76 percent, both slightly higher than last year. Figure 1 shows the history of response rates to the survey. Response rates are inexact because some departments provide only partial data, and some institutions provide a single joint response for multiple departments. Thus, in some tables the number of departments shown as reporting will not equal the overall total number of respondents for that category of department.

To account for the changes in response rate, we will comment not only on aggregate totals but also on averages per department reporting or data from those departments that responded to both this year's and last year's surveys. This will be a more accurate indication of the one-year changes affecting the data.

Departments that responded to the survey were sent preliminary results about faculty salaries in January 2012; these results included additional distributional information not contained in this report. The CRA Board views this as a benefit of participating in the survey.

This year, we modified the manner in which we report data for U.S. CS departments. Degree, enrollment and faculty salary data are stratified according to a) whether the institution is public or private, and b) the tenure-track faculty size of the reporting department. The faculty size strata deliberately overlap, so that data from most departments affect multiple strata. This may be especially useful to departments near the boundary of one stratum. Salary data also is stratified according to the population of the locale in which the institution is located. ${ }^{3}$ This will allow our readers to see multiple views of important data, and hopefully gain new insights from them. These stratification dimensions were recommended by the CRA Surveys Committee ${ }^{4}$, and approved by the CRA Board of Directors, following extensive discussion of various options. We no longer stratify the data according to any ranking of academic departments.

In addition to tabular presentations of data, we will use "box and whisker" diagrams to show medians, quartiles, and the range between the $10^{\text {th }}$ and $90^{\text {th }}$ percentile data points. The March 2012 CRN illustrated the use of these diagrams.

We thank all respondents to this year's questionnaire. Departments that participated are listed at the end of this article.

## Doctoral Degree Production, Enrollments and Employment (Tables D1-D8; Figures D1-D6)

Overall, total Ph.D. production in computing programs (Table D1, Figure D1) held steady in 2010-11, with 1,782 degrees granted compared with 1,772 last year with more departments reporting last year. Among departments reporting both this year and last year, the number of total doctoral degrees increased 5.2 percent.

Next year, the departments predict an increase of nearly nine percent in doctoral degree production, but they notoriously overpredict the number of Ph.D. graduates. A more realistic forecast for next year's production is one comparable to that for this year.

The number of new students per department passing qualifier and thesis candidacy exams in U.S. CS departments (most, but not all, departments have such exams) increased this year. This suggests that the number of doctoral degrees produced will increase in the near term.

The number of new Ph.D. students overall (Table D5) is somewhat less than last year ( 2,812 this year vs. 2,962 last year). However, on a per department basis, this total is comparable to that of last year. The number of new students in CE and I programs also are similar to last year's figures. There was a slight decline in the proportion of new doctoral students from outside North America (Table D5a), from 56.8 percent last year to 56.3 percent this year. Total enrollment in computer science doctoral programs (Table D6) is comparable to that of last year, after accounting for the decreased number of departments reporting this year. However, total enrollment by

Non-resident Aliens is higher in all three computing areas, and the overall level is now at 57.3 percent vs. 51.0 percent last year (Table D8 and Figure D2).

Approximately 73 percent of the doctoral degrees at U.S. CS departments are granted by public universities, though the average per department is similar at public and private universities. A similar fraction of new students ( 74 percent) are at public universities, while a larger fraction of new students from outside North America (approximately 80 percent) are at the public universities. At public universities, there are more students per tenure-track faculty and more degrees are given per tenure-track faculty member in larger departments, while at private universities there is less variability as department size increases (Figures D3, degrees granted, and D4, enrollment).

Figure D5 shows a graphical view of the Ph.D. pipeline for computer science programs. The data in this graph are normalized by the number of departments reporting. The graph offsets the qualifier data by one year from the data for new students, and offsets the graduation data by five years from the data for new students. These data have been useful in estimating the timing of changes in production rates.

Figure D6 shows the employment trend of new Ph.D.s in academia and industry, those taking employment outside of North America, and those going to academia who took positions in departments other than Ph.D.-granting CS/CE departments. Table D4 shows a more detailed breakdown of the employment data for new Ph.D.s. There was an increase in the fraction of new Ph.D.s who took positions in industry (to 47.2 percent vs. 44.7 percent in 2009-10). The 2010-11 level is about the same as that in 2008-09. A smaller fraction of graduates took academic jobs in 2010-11 as compared with 2009-10. The fraction taking tenure-track positions in doctoral granting institutions dropped from 8.2 percent in 2009-10 to 7.1 percent in 2010-11; however, the fraction taking positions in non-Ph.D.granting departments increased to 3.6 percent from 2.4 percent. The fraction taking postdoctoral positions also declined, to 16.8 percent from 19.5 percent, but the fraction taking researcher
positions at doctoral-granting institutions increased from 3.4 percent to 5.1 percent.

The unemployment rate for new Ph.D.s rose somewhat this year, to 1.6 percent from 1.1 percent last year. The proportion of Ph.D. graduates who were reported taking positions outside of North America, among those whose employment is known, declined slightly to 11.0 percent from 11.8 percent in 2009-10.

This year, there was a larger fraction of new Ph.D.s whose employment status was unknown (19.6 percent vs. 15.1 percent last year). It is possible that this skews the real overall percentages for certain employment categories.

Table D4 also indicates the areas of specialty of new Ph.D.s. Artificial intelligence, software engineering, and networking continue to be the most popular areas of specialization for doctoral graduates, though this year software engineering replaced networking as the number two area behind AI. Theory and algorithms, databases, and graphics/visualization remained the next three most popular areas.

A similar fraction of this year's computer science graduates were women ( 18.4 percent vs. 18.8 percent in 2009-10), a smaller fraction of this year's I graduates were women ( 32.5 percent vs. 40.2 percent in 2009-10) and a larger fraction of this year's CE graduates were women ( 22.1 percent vs. 15.4 percent in 200910). A smaller fraction of this year's graduates were White (34.3 percent vs. 36.7 percent in 2009-10). This change was largest at I departments, where there was a 7 percent smaller fraction of Whites and a 7 percent larger fraction of Non-resident Aliens, a reverse of what was experienced last year, but this may reflect differences in the specific departments reporting this year. ${ }^{5}$

## Master's and Bachelor's Degree Production and Enrollments

This section reports data about enrollment and degree production for Master's and Bachelor's programs in the doctoral-granting
departments. Although the absolute number of degrees and students enrolled reported herein only reflect departments that offer the doctoral degree, the trends observed in the master's and bachelor's data from these departments tend to strongly reflect trends in the larger population of programs that offer such degrees.

Master's (Tables M1-M6; Figures M1-M2)
Master's degree production in CS was flat in 2010-11 after accounting for the decreased number of departments reporting. However, master's degree production increased sharply in CE and I departments, resulting in an overall increase in production of 5 percent even with fewer departments reporting overall.

The proportion of female graduates among master's recipients increased from 27.2 percent in 2009-10 to 29.5 percent in 201011. In computer science, the increase was from 21.0 percent to 24.6 percent. A higher fraction of the master's recipients were Black, Hispanic or Asian this year as compared with last year, while there was a somewhat smaller proportion of Whites and Non-resident Aliens receiving master's degrees this year.

The number of new master's students in CS programs this year is similar to last year on a per department basis, though there is an increase in new master's students among CE and I programs. A larger proportion of new master's students are from outside of North America this year as compared with last year ( 56.2 percent vs. 51.2 percent last year).

Despite the neutral to increasing data for new master's students, the number of master's degrees expected next year is less in all three computing areas (CS, CE and I). Total enrollment in master's programs is down compared with last year, so the expectation for fewer degrees in the coming year is consistent with the total enrollment trend.

About two-thirds of the total master's graduates from U.S. CS departments came from public institutions. A slightly smaller proportion of total master's students (63 percent) is at the public universities, and an even smaller proportion of new master's students (about 58 percent) is at these universities. These
fractions are smaller than their doctoral level counterparts. There appears to be no strong correlation among U.S. CS departments, either public or private, between department size and master's enrollment or degree production per tenure-track faculty member (Figures M1 and M2).

## Bachelor's (Tables B1-B6; Figures B1-B4)

For the second straight year, there was a double-digit percentage increase in bachelor's degree production. Among all departments reporting, the increase was 10.4 percent, but if only those departments that reported both years are counted, the increase was 12.9 percent. Similar increases hold in U.S. CS departments (10.5 percent overall and 12.9 percent among those departments who reported both years).

The number of new computing majors among U.S. CS departments rose 6.7 percent ( 7.4 percent among those departments reporting both this year and last year). This is the fourth straight year of increased enrollment in computing majors by new students. Total enrollment in computing majors among U.S. CS departments increased 5.9 percent in aggregate ( 9.6 percent among departments reporting both this year and last year).

The number of CE degrees also increased significantly this year, among U.S. CE departments and among U.S. CS departments who also give CE degrees. Degrees in the information area also increased significantly among U.S. departments offering information degrees, but this may be affected by the categorization of several institutions whose computer science departments and schools of information report jointly. New student enrollment increased in aggregate among departments offering I programs but decreased among those offering CE programs (though it increased among CE departments that reported both years). Total enrollment in both CE and I programs increased in aggregate, though total enrollment decreased in I departments that reported both years. These data suggest increased interest in undergraduate computing degrees of all types within the U.S. It should be noted that the numbers
for CE and I are more volatile due to the small number of departments reporting in each of these areas.

Canadian statistics also are volatile due to the small number of departments reporting. In aggregate, they show slightly decreased degree production, but Canadian response to the survey was unusually low this year and among Canadian departments reporting both years, there was an 11 percent increase in bachelor's degree production. New student enrollment among Canadian departments that reported both years increased by 3.6 percent, but total enrollment in these departments was down a little less than one percent.

The fraction of women among bachelor's graduates decreased in CS this year, from 13.8 percent in 2009-10 to 11.7 percent in 2010-11. In CE and I, the fraction of female graduates increased, to 11.8 percent in CE and to 17.5 percent in I. This year there was a smaller percentage of Whites and greater percentages of Non-resident Alien, Black and Hispanic graduates in CE programs. CS programs, on the other hand, showed a slight increase in the proportion of Whites and a slight decrease in the proportion of Non-resident Alien graduates. I programs had a smaller fraction of Whites, Blacks and Non-resident Aliens, and increased fractions of Asians and Hispanics. Overall, across the three degree areas, about 65 percent of the graduates were White, 15 percent Asian, 7 percent Non-resident Aliens, and 13 percent all other ethnicity categories combined.

Among U.S. CS departments, between 78 and 80 percent of the total bachelor's degrees, new bachelor's students and total bachelor's students are from public universities. These levels are higher than their master's and doctoral level counterparts in all cases except new bachelor's students, where they are approximately the same as for new doctoral students. Larger U.S. CS departments tend to grant more bachelor's degrees per tenure-track faculty member, and public universities tend to grant more bachelor's degrees per tenure-track faculty member than do private universities. While private universities also have higher enrollments per tenure-track faculty member in larger departments, public universities exhibit a less clear trend in
enrollment per tenure-track faculty as department size increases (Figures B3 and B4).

## Faculty Demographics (Tables F1-F7) ${ }^{6}$

Table F1 shows the current and anticipated sizes, in FTE, for tenure-track, teaching and research faculty, and postdocs. In U.S. CS departments, the total tenure-track faculty count of 3,455 is about 6 percent lower than that of last year, but this is consistent with the decrease in the number of departments reporting this year. Canadian departments also showed a significant decrease in faculty numbers due to the decreased number of departments reporting. U.S. CE departments showed a decrease in total tenure-track faculty count despite a slight increase in the number of departments reporting, but this reflects a correction in some ECE departments to better separate EE from CE faculty. U.S. I departments showed an overall increase in faculty numbers, consistent with their increased number of departments reporting. Total counts of teaching and research faculty and of postdocs are similar to those for last year despite the decreased number of departments reporting.

Among U.S. CS departments, the average tenure-track faculty size is slightly larger at private universities than at public universities. Canadian universities, on average, have more tenure-track faculty members per department than do U.S. universities, while on average U.S. I departments are smaller than U.S. CS departments and U.S. CE departments are smaller still. These last two may reflect the fact that we ask departments to report only computing-related faculty, so departments with Library Science or EE programs may report only part of their faculty.

Private universities also tend to have more research faculty and postdocs than do public universities on average, though the teaching faculty per department is similar in public and private universities. Canadian departments have more teaching faculty than do U.S. departments, and have roughly the same number of postdocs per department as do private U.S. CS departments.
U.S. I departments have slightly more teaching faculty as compared with U.S. CS departments, but have research faculty and postdoc averages more in line with U.S. CS departments at public universities. U.S. CE departments are smaller than their U.S. CS departments in all categories.

Table F2 summarizes faculty hiring this past year. There were 245 tenure-track vacancies reported in 2010-11 vs. 211 in 200910 with more departments reporting in 2009-10. Of these vacant positions, 37.6 percent were reported unfilled, higher than the 29.9 percent in 2009-10. Public and private universities had similar success rates, but the overall U.S. CS success rate was only around 60 percent, while U.S. CE, U.S. I, and Canadian departments did much better. For the first time, we report in Table F2a the reasons why positions went unfilled. We will examine trends on this in subsequent survey reports.

The fraction of women hired into tenure-track positions (Table F3) fell sharply in 2010-11, to 21.3 percent from 26.5 percent in 2009-10. The 2010-11 level is similar to that of 2007-08. However, this year's fraction of new female hires still outpaces the 18.4 percent of new female Ph.D.s produced this past year. The fraction of women among new teaching faculty also fell this year as compared with 2009-10. However, the fraction of women among new postdocs rose again this year, from 19.5 percent to 23.6 percent. This year there was a large increase in the percentage of new faculty members whose race/ethnicity is unknown (to 25.2 percent from 5.6 percent). This makes race/ethnicity comparisons with last year less reliable (Table F4).

There was a slight increase in the overall number of faculty losses this year, due to an increased number of persons taking positions elsewhere (either academic or nonacademic). No significant change in retirements is yet evident (Table F5).

This year, there was an increase in the overall fraction of women at the associate professor rank (Table F6), to 17.9 percent from 15.9 percent last year. The overall fraction of female assistant professors dropped slightly, from 25.8 percent to 25.3 percent, and the overall fraction of full professors held steady (12.7 percent). The overall fraction of women among teaching faculty
is slightly lower this year ( 27.0 percent vs. 27.8 percent), while the fraction of women among both research faculty and postdocs is quite a bit higher this year ( 24.2 percent vs. 19.0 percent for research faculty and 21.1 percent vs. 15.8 percent for postdocs). For the second year in a row, there is a larger fraction of Whites and a smaller fraction of Asians and Non-resident Aliens among current assistant professors this year compared with last year (Table F7).

For next year, reporting departments forecast a 2.8 percent growth in tenure-track faculty, similar to what was forecast last year. The largest forecast growth is in U.S. I departments. Departments overall also forecast a large increase in postdocs (more than 10 percent), and a healthy 8.5 percent increase in research faculty for next year.

## Research Expenditures (Table R1; Figures R1-R2)

Table R1 shows the department's total expenditure (including indirect costs or "overhead" as stated on project budgets) from external sources of support. Figures R1 and R2 show the per capita expenditure, where capitation is computed two ways. The first (Figure R1) is relative to the number of tenure-track faculty members. The second (Figure R2) is relative to researchers and postdocs as well as tenure-track faculty. Canadian levels are shown in Canadian dollars. The U.S. CS data for public institutions indicate that the larger the department, the more external funding is received by the department (both in total and per capita). Average research expenditures at private institutions are much less affected by the size of the department. Though the range at U.S. public universities is much greater than that at U.S. private universities, there is no difference in the median research expenditures overall among U.S. public and U.S. private universities.

## Graduate Student Support (Tables G1-G2; Figures G1-G3)

Table G1 shows the number of graduate students supported as full-time students as of fall 2011, further categorized as teaching assistants (TAs), research assistants (RAs), and full-support fellows, and also shows the split between those on institutional vs. external funds. The number of TAs on institutional funds in CS departments decreased 3 percent this year, but this is a lower rate than the decrease in number of departments reporting. A similar situation exists in total RA support; this is coupled with a significant increase in the fraction of RAs supported on external funds. The number of full-support fellows rose with respect to both institutional fund and external fund support. U.S. CE and U.S. I programs each show significant drops in the number of supported RAs, despite an increased number of departments reporting this year. Canadian numbers are down as befits the decrease in number of departments reporting this year.

Table G2 shows the distribution of stipends for TAs, RAs, and fullsupport fellows. U.S. CS data are further broken down in this table by public and private institution, and the higher stipends at private institutions are evident. Figures G1-G3 further break down the U.S. CS data by size of department and by geographic location of the university. Larger departments tend to offer higher stipends, though for full-support fellows this difference doesn't become very visible until the department size is above 20. Departments located in larger population centers also tend to pay higher stipends to TAs and RAs, as would be expected. The data for full-support fellows exhibits no clear trend relative to locale.

## Faculty Salaries (Tables S1-S4; Figures S1-S9)

Each department was asked to report individual (but anonymous) faculty salaries if possible; otherwise, the department was requested to provide the minimum, median, mean, and maximum salaries for each rank (full, associate, and assistant professors and non-tenure-track teaching faculty including postdoctorates) and the number of persons at each rank. The salaries are those in effect on January 1, 2012. For U.S. departments, nine-month salaries are reported in U.S. dollars. For Canadian
departments, twelve-month salaries are reported in Canadian dollars. Respondents were asked to include salary supplements such as salary monies from endowed positions.
U.S. CS data are reported via the box and whiskers diagrams. Data for CE, I, Canadian and new Ph.D.s are reported via tables. Additional salary tables for the U.S. CS departments will be available on the CRA website (www.cra.org/resources/taulbee).

The tables and diagrams contain distributional data (first decile, quartiles, and ninth decile) computed from the department averages only. Thus, for example, a table row labeled "50" or the median line in a diagram is the median of the averages for the departments that reported within the stratum (the number of such departments reporting is shown in the "depts" row). It therefore is not a true median of all of the salaries. Those departments reporting individual salaries were provided more comprehensive distributional information based on individual salaries in January 2012. This year, 88 percent of those reporting salary data provided salaries at the individual level.

We also report salary data based on time in rank, for meaningful comparison of individual or departmental faculty salaries with national averages. We report associate professor salaries for time in rank of 7 years or less, and of more than 7 years. For full professors, we report time in rank of 7 years or less, 8 to 15 years, and more than 15 years.

Overall, the median of the reported U.S. CS average salaries increased between 1.3 and 6.6 percent, depending on tenuretrack rank, and 3.3 percent for non-tenure-track teaching faculty. Full professor salaries had the widest variance, with 1.3 percent for full professors in rank 8-15 years and 6.6 percent for full professors in rank more than 15 years. Assistant professor salaries increased 2 percent and associate professor salary increases ranged from 2.4 to 3.3 percent. The median of average salaries in I departments increased 2 percent for assistant professors, 0 to 1 percent for associate professors, and 2 to 5 percent for full professors, depending on years in rank. For CE departments, assistant professor increases were 3.7 percent, associate professors in the 0 to 3 percent range, and full
professors in the minus-2 to plus-2 percent range. Canadian salary changes were 3.7 percent for assistant professors, 1 to 9 percent for associate professors, and 4 to 11 percent for full professors. The median of average salaries for new Ph.D.s in tenure-track positions at U.S. departments (CS, CE and I combined) increased 4 percent. Because of the small number of departments reporting, comparative salary comments for CE, I and Canadian departments should be viewed with caution.

In all faculty categories, salaries in U.S. CS departments at private institutions tend to be higher than their counterparts at public institutions. Larger departments also tend to have higher salaries than do smaller departments, though for Associate Professors in rank more than 8 years the trend is less clear at both public and private institutions. For full professors at private institutions, the trend is less clear, and for postdocs there is little difference in either public or private institutions as a function of size.

Public universities in larger cities tend to have higher salaries for tenure-track faculty than do their counterparts in smaller locales, except for full professors in rank more than 15 years. It is difficult to make any statements about private universities relative to locale, since there are very few such departments not located in large cities that reported salary data.

## Concluding Observations

Computing enrollments at all degree levels remain strong, and undergraduate enrollments continue to exhibit healthy increases. Within this context, the continued decline in the fraction of doctoral graduates who took tenure-track positions available at North American Ph.D.-granting departments, coupled with a significant increase in the fraction of such positions that went unfilled in U.S. CS departments, is worrisome. The somewhat improved U.S. economy appears to have made more industry positions available, putting further pressure on the ability to attract the best candidates. Hopefully the overall candidate pool
is sufficiently qualified to meet the collective needs of the community, but these hiring data will bear watching.

## Participating Departments

U.S. CS Public (105 departments): Arizona State, Auburn, City University of New York, Graduate Center, Clemson, College of William \& Mary, Colorado School of Mines, Colorado State, Florida International, George Mason, Georgia Tech, Georgia State, Indiana, Iowa State, Kansas State, Kent State, LSU, Michigan State, Michigan Technological, Mississippi State, Montana State, Naval Postgraduate School, New Jersey Institute of Technology, New Mexico State, North Carolina State, North Dakota State, Ohio State, Ohio, Old Dominion, Oregon State, Penn State, Portland State, Purdue, Rutgers, Southern Illinois Carbondale, Stony Brook (SUNY), Texas A\&M, Texas Tech, the Universities at Albany and Buffalo (SUNY); Universities of Alabama (Birmingham and Tuscaloosa), Arizona, Arkansas at Little Rock, California (Berkeley, Davis, Irvine, Los Angeles, Riverside, San Diego, Santa Barbara, and Santa Cruz, Central Florida, Cincinnati, Colorado (Boulder), Connecticut, Delaware, Florida, Georgia, Houston, Idaho, Illinois (Chicago and UrbanaChampaign), Iowa, Kansas, Kentucky, Louisiana at Lafayette, Maryland, Maryland Baltimore County, Massachusetts ( Amherst, Boston), Michigan, Minnesota, Mississippi, Missouri (Columbia), Nebraska (Omaha, Lincoln), Nevada (Las Vegas, Reno), New Hampshire, New Mexico, North Carolina (Chapel Hill, Charlotte), North Texas, Oklahoma, Oregon, Pittsburgh, Rhode Island, South Carolina, South Florida, Tennessee (Knoxville), Texas (Arlington, Austin, Dallas), Utah, Virginia, Washington, Wisconsin (Madison), and Wyoming; Virginia Commonwealth, Virginia Tech, Washington State, Wayne State, Western Michgan, and Wright State.
U.S. CS Private ( $\mathbf{3 7}$ departments): Boston University, Brown University, Carnegie Mellon, Case Western Reserve, Columbia, Cornell, Dartmouth, DePaul, Drexel, Duke, Florida Institute of Technology, Harvard, Illinois Institute of Technology, Johns Hopkins, Lehigh, Massachusetts Institute of Technology, New York, Northeastern, Northwestern, Pace, Polytechnic, Princeton, Rensselaer, Rice, Rochester Institute of Technology, Stanford,

Stevens Institute of Technology, Toyota Technological Institute, Tufts; the Universities of Chicago, Notre Dame, Pennsylvania, Rochester, and Tulsa; Washington University in St. Louis, Worcester Polytechnic Institute, and Yale.

## U.S. Computer Engineering ( $\mathbf{1 3}$ departments): Boston

 University, Florida Institute of Technology, Mississippi State, North Carolina State, Northeastern, Ohio State, Santa Clara; Universities of California (Santa Cruz), Illinois (Urbana Champaign), Iowa, New Mexico, and Southern California; Virginia Tech.
## U.S. Information Programs ( 16 departments): Cornell,

 Drexel, Indiana, Penn State, Syracuse, University at Albany (SUNY); Universities of California (Berkeley, Irvine, Los Angeles, Santa Cruz), Maryland Baltimore County, Michigan, North Carolina (Chapel Hill), Pittsburgh, Texas (Austin), and Washington.Canadian (13 departments): Concordia, McGill, Memorial University of Newfoundland, Simon Fraser ; Universities of British Columbia, Calgary, Manitoba, Ottawa, Saskatchewan, Toronto, Waterloo, and Western Ontario; York.

[^0]population between 100,000 and 250,000. Town/rural populations are less than 100,000.
${ }^{4}$ Carla Brodley, Susanne Hambrusch, Jim Kurose, CRA Executive Director Andy Bernat and the authors comprised the Surveys Committee that made the recommendations for the new stratifications.
${ }^{5}$ All ethnicity tables: Ethnic breakdowns are drawn from guidelines set forth by the U.S. Department of Education. ${ }^{6}$ All faculty tables: The survey makes no distinction between faculty specializing in CS vs. CE programs. Every effort is made to minimize the inclusion of faculty in electrical engineering who are not computer engineers.

[^0]:    ${ }^{1}$ The title of the survey honors the late Orrin E. Taulbee of the University of Pittsburgh, who conducted these surveys for the Computer Science Board until 1984, with retrospective annual data going back to 1970.
    ${ }^{2}$ Information (I) programs included here are Information Science, Information Systems, Information Technology, Informatics, and related disciplines with a strong computing component. In fall 2008, the first year these programs were surveyed as part of Taulbee, surveys were sent to CRA members, the CRA Deans group members, and participants in the iSchools Caucus (www.ischools.org) who met the criteria of granting Ph.D.s and being located in North America. Other I-programs who meet these criteria and would like to participate in the survey in future years are invited to contact survey@cra.org for inclusion.
    ${ }^{3}$ Classification of the population of an institution's locale is in accordance with the Carnegie Classification database. Large cities are those with population $>=250,000$. Mid-size cities have
