# 2018 Taulbee Survey <br> Undergrad Enrollment Continues Upward; Doctoral Degree Production Declines but Doctoral Enrollment Rises 

## By Stuart Zweben and Betsy Bizot

#### Abstract

This article and the accompanying figures and tables present the results from the 48th annual CRA Taulbee Survey'. The survey, conducted annually by the Computing Research Association, documents trends in student enrollment, degree production, employment of graduates, and faculty salaries in academic units in the United States and Canada that grant the Ph.D. in computer science (CS), computer engineering (CE), or information (I) ${ }^{2}$. Most of these academic units are departments, but some are colleges or schools of information or computing. In this report, we will use the term "department" to refer to the unit offering the program.

CRA gathers survey data during the fall. Responses received by February 14, 2019 are included in the analysis. The period covered by the data varies from table to table. Degree production and enrollment (Ph.D., Master's, and Bachelor's) refer to the previous academic year (2017-18). Data for new students in all categories refer to the current academic year (2018-19). Projected student production and information on faculty salaries are also for the current academic year; salaries are those effective January l, 2019.

We surveyed a total of 283 Ph.D.-granting departments and received responses from 174, for an overall response rate of 61 percent. This is lower than last year's 181 respondents and 64 percent response rate. One contributing factor to the lower response rate may be the additional questions about department profiles that are only asked every three years, along with some new questions to learn more about enrollment responses and the use of teaching faculty. The response rates from CE and Canadian departments in particular continue to be low. The U.S. CS response rate of 73 percent is, as usual, the highest of all of the categories, although it also dropped from last year's 77 percent. Figure l shows the history of the survey's response rates. Response rates are inexact because some departments provide only partial data, and some institutions provide a single joint response for multiple departments. Thus, in some tables the number of departments shown as reporting will not equal the overall total number of respondents shown in Figure 1 for that category of department.

To account for the changes in response rate, we will comment not only on aggregate totals but also on averages per department reporting or data from those departments
that responded to both 2017 and 2018 surveys. This is a more meaningful indication of the one-year changes affecting the data.

Departments that responded to the survey were sent preliminary results about faculty salaries in December 2018; these results included additional distributional information not contained in this report. The CRA Board views this as a benefit of participating in the survey.

Degree, enrollment, and faculty salary data for the U.S CS departments are stratified according to: a) whether the institution is public or private; and b) the tenure-track faculty size of the reporting department. The faculty size strata deliberately overlap, so that data from most departments affect multiple strata. This may be especially useful to departments near the boundary of one stratum. Salary data is also stratified according to the population of the locale in which the institution is located. ${ }^{3}$ These stratifications allow our readers to see multiple views of important data, and hopefully gain new insights from them. In addition to tabular presentations of data, we will use "box and whisker" diagrams to show medians, quartiles, and the range between the 10th and 90th percentile data points.

This year's survey includes for the first time data about the existence of online and hybrid master's programs, and about the size of startup packages for new assistant professors. We also obtained more fine-grained information about teaching faculty and about the previous position held by new faculty hires. This year's survey also included questions asked only every three years, about such matters as teaching loads, space, support staff, recruitment incentives and reasons for salary differential among grad students, and sources of external research funding.

## 2018 Taulbee Survey (continued)

We took advantage of this extra section to also include a few questions about the manner that departments are responding to the undergraduate enrollment surge, to see if there are any noticeable changes from three years ago. We will comment on the results of one of these enrollment surge questions in this report; a supplementary report with more complete results will be published in the June issue of Computing Research News.

We thank all of the respondents to this year's questionnaire. The participating departments are listed at the end of this article. CRA member respondents will again be given the opportunity to obtain certain survey information for a selfselected peer group. Instructions for doing this will be emailed to all such departments.

Figure 1. Number of Respondents to the Taulbee Survey

| Year | US CS Depts. | US CE Depts. | Canadian | US Information | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1995 | 110/133 (83\%) | 9/13 (69\%) | 11/16 (69\%) |  | 130/162 (80\%) |

## Doctoral Degree Production, Enrollment, and Employment

(Tables I, DI-DIO; Figures DI-D6)

## Degree Production

On a per department basis, doctoral degree production declined somewhat in 2017-18. This year's respondents produced 12.6 degrees per U.S. CS department, and 12.1 degrees per department
overall. This compares with 13.1 and 12.4 , respectively, reported last year. Although more departments reported their Ph.D. production this year, the 2017-18 production was 1,787 compared with 1,818 degrees produced in 2016-17 (Table DI).

Among all departments reporting both this year and last year, the number of total doctoral degrees declined by 1.8 percent. Among U.S. CS departments reporting both years, the decline was 2.8 percent (Table I).

Table DI. PhD Production and Pipeline by Department Type

| Department Type | \# Depts | PhDs Awarded |  | PhDs Next Year |  | Passed Qualifier |  | Passed Thesis (if dept has) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 2018 Taulbee Survey (continued)

For the second year in a row, the percentage of women among Ph.D. recipients increased. In 2017-18, women received 19.3 percent of CS doctoral degrees and 21.3 percent of all doctoral computing degrees (Table D2). A greater percentage of non-resident Aliens comprised 2017-18 Ph.D. recipients in all three areas (CS, CE and I) compared with 2016-17 recipients. A smaller percentage of Ph.D.s were Asian and and a larger percentage were Black/African-American in 2017-18 among CS recipients, while a smaller percentage were Hispanic and a larger percentage were White among I recipients (Table D3). The combined percentage of CS doctoral graduates who were American Indian or Alaska Native, Black or African American, Native Hawaiian/Pacific Islander, Hispanic, or Multiracial NonHispanic was only 3.8 percent, though that represents a gain of about one percentage point over 2016-17.

As we have found in previous years, Non-resident Aliens comprised a higher percentage of the CS female doctoral graduates than they did CS male graduates, while Whites comprised a lower percentage of the female graduates as compared with male graduates. The percentage differences
are greater for 2017-18 graduates than they were for 2016-17 graduates (Table D9).

## Doctoral Program Enrollment

Despite the decline in doctoral degree production, total doctoral enrollment increased by 7.9 percent among programs that reported both years. If only U.S. computer science departments are considered, the increase was 7.7 percent (Table l). For the third straight year, total doctoral enrollment by gender is more diverse in all department areas (CS, CE, and I). The overall fraction of current doctoral students who are women is 23.5 percent, versus 22.1 percent last year (Table D7). In CS, women comprise $22.3 \%$ of the students currently enrolled. The fraction of doctoral students who are neither Non-resident Aliens, Asian, nor White rose to 7 percent from under 5 percent. This is true overall and also within CS programs (Table D8).

As has been true in previous years, Non-resident Aliens comprise a higher percentage of the enrolled women than they do the enrolled men, although only by one percentage point. Whites continue to comprise a lower percentage of enrolled women than

## 2018 Taulbee Survey (continued)

enrolled men. Again this year, resident Asians comprise a higher percentage of enrolled Asian women than they do Asian men.

Among those pursuing I degrees, 57 percent of the men and an equal percent of the women are Non-resident Aliens or Resident Asians. For the second consecutive year, Whites comprise a higher percentage of men than they do women among those pursuing I degrees (Table DIO).

At U.S. CS departments, the average number of students per department who passed qualifier exams in 2017-18 was 17.2, an increase over the 16.1 reported the previous year. Both public and private institutions reported increases for the second year in a row. The average number per U.S. CS department who passed thesis candidacy exams in 2017-18 (most, but not all, departments have such exams) also increased from 2016-17 at both public and private institutions (Table DI).

The number of new Ph.D. students per department reporting increased this year compared with those from last year's reporting departments (Tables 1 and D5) among all types of departments except CE. U.S. CS departments reported an average increase of 17.2 percent. Among departments that reported both years, the number of new Ph.D. students increased 16.9 percent overall and 18.2 percent among U.S. CS departments.

The proportion of new doctoral students from outside North America dropped this year to 59.3\% from 64.5\% last year. There were increases at US CE and US Info departments, while there were decreases in U.S. CS and Canadian departments (Table D5a).

Figure D5 shows a graphical view of the Ph.D. pipeline for U.S. computer science and Canadian departments, the main producers of CS doctoral degrees. The data in this graph are normalized by the number of reporting departments. The graph offsets the qualifier data by two years from the data for new students, and offsets the graduation data by five years from the data for new students. These data have been useful in estimating the timing of changes in production rates. The graph suggests little change in doctoral production during the next year, but growth afterward. However, departments are forecasting a double-digit percent increase in production during 2018-19 (Table DI). Last year's forecast double-digit percentage increase in departmental production clearly was not realized.

## Ph.D. Employment

Figure D6 shows the employment trend of new Ph.D.s in academia and industry within North America, those taking employment outside of North America, and those going to academia in North America who took positions in departments other than Ph.D.-granting CS and CE departments. Table D4

Figure D3. PhD Degrees Granted by Tenure-Track Size
CRA Taulbee Survey 2018

Figure D4. PhD Enrollment Normalized by Tenure-Track Size CRA Taulbee Survey 2018

## 2018 Taulbee Survey (continued)

Computing Research Association
shows a more detailed breakdown of the employment data for new Ph.D.s. The percentage of new Ph.D.s who took positions in North American industry was 57.0 percent, down from the 59.4 percent reported last year but similar to the level of two years ago. Among those doctoral graduates who went to North American industry and for whom the type of industry position was known, about 63 percent took research positions (Table D4a). This is higher than the 57 percent reported in 2017. This year, definitive data was provided for over 92 percent of the graduates who went to North American industry, an increase over the 89 percent last year.

After a dip reported last year, the percentage of Ph.D. graduates who took North American academic jobs rose in 2017-18 to 31.2 from 28.2 in 2016-17. The percentage of graduates taking tenure-track positions in North American doctoral-granting computing departments rose from to 9.8 in 2016-17 to 10.7 in 2017-18. The percentage taking positions in North American non-Ph.D.granting computing departments dropped from 2.8 percent in last year's report to 1.8 percent, while the percentage taking North American academic postdoctoral positions rose from 10.7 percent to 11.9 percent.

Among those whose employment is known, the proportion of Ph.D. graduates who were reported taking positions outside of North America was 7.4 percent, similar to last year's reported value. In 2017-18, 26 percent of those employed outside of North America went to industry. This is similar to the percentage reported in each of the past two years. Twenty-seven percent went to tenuretrack academic positions, lower than last year's 30 percent, while 14 percent went to academic postdoctoral positions, lower than the 18 percent reported last year but near the level of two years ago. Most of the doctoral graduates who went to non-North American industry positions take non-research positions. Definitive data was provided for 96 percent of the graduates who went to non-North American industry positions.

When academic and industry postdocs are combined, the result is that 14.8 percent of 2017-18 doctoral graduates whose employment was known took some type of postdoctoral position. This is slightly higher than the 13.8 percent reported last year. As was the case in 2016-17, thirteen percent of these were industry postdocs.

## 2018 Taulbee Survey (continued)

The unemployment rate for new Ph.D.s again this year was below 1 percent. However, 24.8 percent of new Ph.D.s' employment status was unknown; in 2016-17 it was 22.7 percent. The lack of information about the employment of nearly one in four graduates may skew the real overall percentages for certain employment categories.

Table D4 also indicates the areas of specialty of new Ph.D.S. Artificial intelligence/machine learning, software engineering, networks, and security/information assurance are the most popular areas of specialization for doctoral graduates, in that order. These four areas comprise 37 percent of all the doctoral degrees produced in 2017-18. There are many Ph.D.S categorized as "other," and some whose specialty area is reported as "unknown".

## Master's and Bachelor's Degree Production and Enrollments

This section reports data about enrollment and degree production for master's and bachelor's programs in the doctoral-granting departments. Although the absolute number of degrees and enrolled students reported herein only reflect departments that offer the doctoral degree, the trends observed in the master's and bachelor's data from these departments tend to strongly reflect trends in the larger population of programs that offer such degrees.

## Master's

(Tables MI-M8; Figures MI-M2)
On a per department basis, CS master's degree production in U.S. CS departments was about 2.5 percent less than in 201617; however, this follows three consecutive years of double-

digit percent increases. There was a 4.5 percent drop among departments at public institutions and a 3.5 percent increase among those at private institutions.

Overall master's degree production per department in the Information area rose 3.7 percent in 2017-18, while Canadian production showed a 34 percent increase. Only three CE departments reported master's production, so no comparison is made for this area (Table MI).

The proportion of female graduates among CS master's degree recipients rose slightly, from 26.1 percent to 26.5 percent. The CE and I areas also showed increases in gender diversity, with the I area now close to parity between men and women. Aggregating all areas, the percentage of master's degrees to women increased from 29.6 to 30.6 percent (Table M2).

In CS, 70.0 percent of master's degrees went to Non-resident Aliens, a decrease from the 73.8 percent in 2016-17 and 75.6
percent in 2015-16. Drops in the percentage of Non-resident Aliens also occurred in the CE and I areas, with the aggregate percentage over all three areas declining from 69.2 to 65.4 percent. As was the case in last year's report, the CS decline in non-resident Alien percentage was countered by gains among Whites and resident Asians. The percentage of master's recipients among American Indian/Alaska Native, Black/AfricanAmerican, Native Hawaiian/Pacific Islander, Hispanic, and Multiracial in CS was approximately 3.6 percent in 2017-18 versus 3.0 percent in 2016-17; the increase occurred largely among Hispanics. (Table M3).

As has been the case in recent years, Non-resident Aliens again comprised a much larger proportion of female CS and CE degree recipients than male CS and CE degree recipients, while Whites comprised a larger percentage of male CS and CE degree recipients than female CS and CE degree recipients (Table M7). In the I area, Non-resident Aliens again comprised a larger percentage of male master's graduates than female master's

## 2018 Taulbee Survey (continued)

Computing Research Association
graduates, and Whites comprised a smaller percentage of male master's graduates than female master's graduates. This trend is likely to continue into the near future based on the current enrollment breakdown by gender and ethnicity (Table M8).

The average number of new master's students enrolled in U.S. CS departments rose from 106.5 to 123.5. As was the case last year, U.S. CS departments at both public and private institutions experienced increases (Table M5). This suggests that this year's observed master's production decline is likely to be short-lived.

The fraction of new master's students in U.S. CS departments that is reported to be from outside North America in 2018-19 was 60.0 percent, compared with 63.6 percent in 2017-18 from 67.5 percent in 2016-17 (Table M5). This year there was a sharp decline among departments at public institutions, from 70.6 to 58.0 percent; private institutions showed only a slight decline, from 65.0 percent to 64.2 percent. At U.S. Information departments, the fraction of new master's students from outside North

America declined from 42.8 percent to 40.2 percent, the second straight year of decline.

This year, we asked for information about the types of master's programs offered by our departments; specifically, we asked if the department offered only professional master's, only "academic" master's, or both types. Of the 167 departments that responded to this year's Taulbee Survey, all but one reported having master's programs. Of the 159 departments who responded to the question about the breakdown of these programs into professional and academic, 36 (23 percent) had only professional master's, and 55 ( 35 percent) had both. Of the 123 total professional master's programs, 23 percent were offered totally online and another seven percent were offered in hybrid format. Of the 148 total academic master's programs, 11 percent were offered online and six percent were offered in hybrid form. About 78 percent of the online programs are reported to the Taulbee survey and so are included in the master's statistics reported earlier in this section.

## Bachelor's

(Tables I, BI-B8; Figures BI-B4)
The 2017-18 academic year marked the fifth consecutive year of double-digit percentage increases in bachelor's degree production. Overall degree production, aggregated across all three areas of computing, is 14.4 percent higher at this year's reporting departments than it was at last year's reporting departments. In U.S. CS departments, the increase is 18.1 percent.

When considering only those departments that reported both years, the increase was 18.2 percent among all departments and 20.1 percent among U.S. CS departments (Table 1). When only the CS area is considered, bachelor's degree production per department increased 21.4 percent at U.S. CS departments, and it increased 21.1 percent among all reporting departments (Table BI).

Figure Bl shows the trend in total computing bachelor's degree production since 1995 for all departments reporting to the

Taulbee Survey. Based on current and recent enrollments, continued increases in CS bachelor's degree production are likely to continue for the next few years.

The upward trajectory in bachelor's enrollment continues; there was an increase in the number of new undergraduate computing majors for the eleventh consecutive year. This year's respondents reported 13.6 percent more new majors than did
last year's respondents, with an average of 17.8 percent more per department (Tables 1 and B5). The increase in new majors is 25.7 percent when considering only those departments reporting both this year and last year. Among U.S. computer science departments, the increase in overall new majors was 14.7 percent overall ( 15.7 percent per department), and 25.9 percent among departments reporting both this year and last year. If only increases in new CS majors at U.S. CS departments are

CRA Taulbee Survey 2018

## 2018 Taulbee Survey (continued)

## 2018 Taulbee Survey (continued)

considered, the average increase is 13.9 percent per department. Figure B2 illustrates the trend in the total number of newly declared computing undergraduate majors as reported in the Taulbee Survey.

Total undergraduate enrollment in computing majors among U.S. CS departments (i.e., the sum of the number of new and continuing majors in CS, CE, and I at these departments) increased 6.6 percent (also 9.3 percent per department) when all respondents are compared, and increased 10.6 percent among U.S. CS departments reporting both this year and last year (Tables 1 and $B 6$ ).

Per-department averages smooth out comparisons from year to year when there are differences in the number of reporting departments, but the averages include both very large and very small departments. Figures B3 and B4 show the distribution of number of degrees awarded (Figure B3) and total enrollment (Figure B4) per tenured or tenure-track faculty member, in department size groupings for the U.S. CS departments. Among public institutions, larger departments produce more bachelor's degrees per tenure-track faculty member than do smaller departments; for private institutions, there is little difference by department size. Departments from private institutions enroll
fewer bachelor's students per tenure-track faculty than do departments from public institutions. Neither public nor private institutions show a clear relationship between faculty size and enrollment per tenure-track faculty member.

The enrollment increases in CS continue to be of particular interest to our community. This year's Taulbee Survey data shows that the per-department enrollment of CS bachelor's majors in U.S. CS departments increased by 8.7 percent over last year. While lower than the 13.3 percent increase reported last year and the 24.8 percent increase reported two years ago, this increase is still considerable given the sustained growth surge of more than decade and the capacity barriers that have caused several departments to limit entrance into the major. Figure B5 shows the enrollment trend from Taulbee Survey data since this surge began. The average enrollment per U.S. CS department has increased over 360 percent during this period; that is, it has more than quadrupled. For the past five years, it has exceeded the previous peak reached during the dot-com enrollment surge.

As noted in the introduction, we asked various questions this year about how departments are responding to the enrollment

## 2018 Taulbee Survey (continued)

surge, so that we may compare the situation today with that of three years ago when CRA issued its "Generation CS" report. A separate report on the results of this year's questions is expected to be distributed in the June 2019 issue of Computing Research News, However, we can report here the results of one basic question comparing the difficulty in managing the bachelor's level enrollment situation now versus three years ago. As might be expected from the enrollment data we have reported above, most departments find it harder to manage now than they did three years ago. Among the 141 total departments responding to this question, 44 percent said that it is much more difficult to manage now, and an additional 29 percent said it was somewhat more difficult to manage now. Only four percent said it was somewhat easier, and the rest said it was about the same. These statistics are similar when only U.S. CS departments (122 of the 141) are considered.

Another view of bachelor's enrollments can be gleaned from CS course-level data. Such data was first reported in CRA's Generation-CS report for the fall terms in 2005, 2010 and 2015. The Taulbee Survey began collecting follow-up data in the 2016 survey, and now does so annually. Table B9 shows four-year enrollment trends for the four types of courses for which data
is collected (representative introductory course for non-majors, introductory course for majors, mid-level course, and upperlevel course). For each type of course, only those departments are included that reported data for each of the four years and reported on the same course in each of the four years. The data indicate that median enrollment in the introductory course for non-majors, the introductory course for CS majors, and the mid-level course each is at its highest level in 2018 among the four years 2015-18. However, only the mid-level course shows a steadily increasing median over the four-year period. The table further shows that the median percent of non-majors in the introductory course for majors is at its highest level in 2018. In last year's survey, we observed that the median percent of non-majors in the introductory course for majors had been declining over a three-year period. This year's observation about the percent of non-majors in the introductory course for majors may reflect differences in what is happening at the seven departments that did not report in 2018 but reported in 2015-17, relative to the 32 departments that reported all four years.

Gender diversity among bachelor's graduates, both overall and in CS, improved again in 2017-18. Women comprised 21.2 percent

of all graduates and 20.9 percent of CS graduates in 2017-18. In CE, the percentage of women among bachelor's graduates was 15.6 percent compared with the 12.6 percent reported last year, and the percentage of women among I graduates increased from 25.0 percent to 26.8 percent (Table B2). The percentage of CS bachelor's degrees awarded to Whites continued to decline, from 47.6 percent in 2016-17 to 45.4 percent in 2017-18, while the percentage awarded to Asians rose from 25.9 percent to 26.5 percent and the percentage awarded to Non-resident Aliens rose from 12.5 percent to 13.9 percent. As was the case in last year's report, changes in other ethnicity categories were less than 1 percent in CS. In aggregate across the three areas of computing, 45.7 percent of the graduates were White, 25.4 percent Asian, 13.0 percent Non-resident Aliens, and 15.8 percent all other ethnicity categories combined. However, in I programs, the other ethnicity categories accounted for approximately 23 percent of the graduates (Table B3).Gender and ethnicity distributions of enrolled students (Table B8) suggest that improvements in the diversity of computing graduates are not likely to happen any time soon.

In all three computing areas (CS, CE, and I), Resident Asians and Non-resident Aliens continue comprise a larger fraction of female enrollment than male enrollment, while Whites comprise a larger fraction of male enrollment than female enrollment (Table B8). Table B7 indicates that the same comparisons continue to hold true for degree awardees.

## Faculty Demographics

(Tables FI-F9; Figure FI) ${ }^{4}$
Table Fl shows the current and anticipated sizes, in FTE, for tenure-track, teaching, and research faculty, and postdocs. The total tenure-track faculty count in U.S. CS departments increased by 4.5 percent over last year, and the average tenure-track faculty size increased by 3.2 percent. In U.S. CS departments, the total teaching faculty count increased from 947 to 1107 (16.9 percent).

This year, we asked departments to report their teaching faculty in two categories, based on results of last year's Teaching Positions survey conducted by a CRA special committee. Because position titles vary widely across institutions, the survey instructions gave guidance on categorizing faculty based on

## 2018 Taulbee Survey (continued)

responsibilities and expectations. "Teaching Professors" on average have more varied responsibilities in teaching, scholarship, service/governance, etc., and higher expectations for visibility outside the unit or the institution. "Other Instructors" are more focused on teaching introductory or mid-level courses and tend to have shorter contract lengths, though they are still full time faculty (Taulbee does not collect data on course-by-
course adjuncts). In U.S. CS departments, the number of persons in these two categories was split fairly evenly at public institutions, but decidedly in favor of Teaching Professors at private institutions. U.S. CE and I departments, as well as Canadian departments, also reported a decided preference for the Teaching Professor category of teaching faculty.

Table F2a. Reasons Positions Left Unfilled

## 2018 Taulbee Survey (continued)

The total number of research faculty reported at U.S. CS departments rose to 426 from the 408 reported last year, while the total number of postdocs dropped from 567 to 531 . About half of the U.S. CS departments providing faculty data to this year's survey reported having any research faculty, and this was true among both public and private universities. About half of public and twothirds of private U.S. CS departments reported having any postdocs.

Table F5. Faculty Losses

| Died | 7 |
| :--- | ---: |
| Retired | 94 |
| Took Academic Position Elsewhere | 126 |
| Took Nonacademic Position | 34 |
| Remained, but Changed to Part Time | 23 |
| Other | 11 |
| Unknown | 8 |
| Total | 303 |

Figure Fl illustrates the comparative changes at U.S. CS departments in undergraduate enrollment, tenure-track faculty and teaching faculty since 2006, when the current enrollment surge began. This figure updates with recent years' data a figure from the Generation-CS report. It illustrates the continuing challenge to obtain sufficient instructional resources to deal effectively with the increased enrollments.

Canadian departments, on average, are larger than U.S. CS departments, in terms of both tenure-track and total faculty, while U.S. I and CE departments, on average, are smaller than U.S. CS departments on both counts. This follows the pattern of previous years. The observations about U.S. CE and I departments may reflect the fact that we ask departments to report only computing-related faculty, so departments with Library Science or EE programs may report only part of their faculty.

Among U.S. CS departments, those at private universities are on average larger than those at public universities in both tenure-

track and total faculty size. This also follows the pattern of previous years.

Table F2 summarizes faculty hiring this past year. The success rate for hiring tenure-track faculty at U.S. CS departments was 77.5 percent this year. The success rate among departments at public universities was again higher than that at private universities (79.4 percent vs 72.8 percent). Again this year, Canadian departments had lower success rates, on average, than did other types of departments. In aggregate across all types of departments, the tenure-track hiring success rate decreased from 82.7 percent to 77.3 percent.

Among those hired into all categories of academic positions (tenure-track, teaching faculty, research faculty, and postdoc) for 2018-19, 22.9 percent were women, down from last year's 24.9 percentage (Table F3). However, among those newly hired into tenure-track positions, the proportion of women rose from 20.8 percent last year to 22.9 percent this year. The percentage of women among new tenure-track faculty hires and the percentage of women among newly hired faculty overall both are once again higher than the percentage of new female Ph.D.s produced during the past year.

Among new tenure-track faculty, the fraction who are White again declined, from 41.8 percent to 37.5 percent, while the fraction who are Non-resident Alien or Asian new hires increased from 47.7 percent to 51.0 percent. Whites dominated both categories of newly hired teaching faculty, with Asians and Non-resident Aliens accounting for much of the remainder. Among research faculty, Whites comprised 43.4 percent of new hires, while Non-resident Aliens or resident Asians in aggregate comprised 39.6 percent of new hires. Both figures are lower than those reported last year. Among postdoc new hires, Whites comprised 32.8 percent, compared to 28.7 percent last year, while Non-resident Aliens and resident Asians collectively comprised 53.9 percent, similar to last year's percentage (Table F4).

Since 2015, the Taulbee Survey has been collecting information on the number of new faculty hires who had been postdocs in the previous year. For newly hired assistant professors, the fraction who had been postdocs ranged from 21 to 31 percent over the three years of prior data collection. We expanded the question on sources of new faculty this year to learn more about faculty movement between industry and academia, and between academic institutions. Table F10 summaries the results. Of the

Figure Fl. Comparative Change in Majors and Instructional Resources per Unit CRA Taulbee Survey 2018

288 assistant professors hired for the 2018-2019 academic year for whom the source was known, 39 percent were new PhDs, 26 percent had postdocs the previous year (this is within the range of the previous three years), 29 percent came from other academic institutions, and 6 percent came from industry. We don't know the previous academic rank of the new assistant professors who came from other institutions; they might have been teaching faculty or research faculty as a transitional position, or they might have come from other tenure-track positions. Of the 67 full and associate professors whose source was reported, 78 percent came from other academic institutions and 13 percent from
industry. We also asked about faculty hired without PhDs; in the two teaching faculty categories, 25 percent of Teaching Professors and 74 percent of Other Instructors were hired without PhDs.

Another new feature of this year's survey was the collection of certain information about startup packages, exclusive of equipment costs, for new assistant professors. Among the 107 U.S. CS departments that responded to our question about the size of the startup package, the median of the average offered package was $\$ 250 \mathrm{~K}$. The median among departments at public institutions was slightly lower (\$240K), while the median for

## 2018 Taulbee Survey (continued)

those at private institutions was slightly over \$350K. Packages at I-departments had a median of \$220K, while those at Canadian institutions has a median of $\$ 97.5 \mathrm{~K}$ in Canadian dollars. We also asked the departments if there were limits to how long this startup funding was available for use. Of the 140 total departments that responded, only 18 percent had no set limit. The typical maximum number of years was three.

There was a 29.5 percent increase in faculty losses reported this year as compared with last year (Table F5). The biggest increase was in persons taking academic positions elsewhere; not only did the raw number increase (from 85 to l26), but also this category's fraction of the total losses increased (from 36.3 percent to 41.6 percent). This is consistent with what we learned about the source of new hires. A greater percentage of the faculty losses this year also were due to persons who changed to part time (from 5.1 percent to 7.6 percent of the total). While retirements were up from 80 to 94, this category's percent of the total dropped from 34.2 to 31.0. The number of persons taking nonacademic positions elsewhere went from 26 to 34, but this was the same fraction of the total losses as was reported last year.

The proportion of women currently at each of the three tenuretrack faculty ranks stayed within one-half of a percentage point of the corresponding value reported last year, with slight drops at the assistant and full professor level and a slight increase at the associate professor level. There was a slight increase in the proportion of women among teaching faculty, with only a one percentage point difference in the proportion of women between the two teaching faculty categories. The proportion of women among research faculty and postdocs each were within one percentage point of their respective values reported last year (Table F6).

Among the 164 departments who report gender by ethnicity breakdowns (which represents the vast majority of departments), Whites comprise a slightly greater percentage of female full professors than they do male full professors; a similar situation is present at the assistant professor level, while the reverse is true at the associate professor level. Asians comprise a greater percentage of males than they do females at both the full and assistant professor levels while the reverse is true at the associate professor level (Table F8). Among teaching and research faculty, Whites comprise over three-fourths of those for whom ethnicity was known, while they comprise only slightly over onethird of the postdocs (Tables F9a and F9b). Non-resident Aliens and Asians account for 50 percent of the postdocs.

For next year, U.S. CS departments forecast an average 6.4 percent growth in tenure-track faculty and 7.3 percent growth in teaching faculty (Table Fl). The tenure-track forecast is lower than that made last year, while the teaching faculty forecast is the same as that last year. Departments also forecast an average 10.0 percent growth in postdocs, higher than that forecast last year. Actual hiring exceeded last year's expectations for teaching faculty hiring, while falling short in their expected hiring for both tenure-track faculty and postdocs.

## Research Expenditures

(Table RI; Figures RI-R2)
Table Rl shows the distribution of departments' total research expenditure (including indirect costs or "overhead" as stated on project budgets) from external sources of support. Figures Rl and R2 show the per capita expenditure, where capitation is computed two ways. The first (Figure RI) is relative only to the number of tenure-track faculty members. The second (Figure R2)

Table RI. Total Expenditure from External Sources for Computing Research

Figure R2. Research Expenditures Normalized by Tenure-Track + Research Faculty + Postdoctorates

CRA Taulbee Survey 2018

is relative to research faculty and postdocs as well as tenuretrack faculty. Canadian levels are shown in Canadian dollars.

Overall median research expenditures for 2017-18 at U.S. CS public departments increased 30.7 percent in comparison with 2016-17. Last year's reported increase was just 8.7 percent. At U.S. CS departments in private institutions, median expenditures rose 25.8 percent compared with a 19.6 percent increase last year. The median research expenditure at U.S. CS departments in private institutions remains considerably higher that of public institutions. Median expenditures at U.S. I departments rose 49.4 percent over last year's figure, after being relatively flat in
last year's report. Canadian departments showed a 9.7 percent increase in median expenditure over last year, versus a one percent increase last year. The sample size for I departments and Canadian departments is small, which makes these comparisons subject to more volatility.

The U.S. CS data show a tendency for larger departments to have more external funding per capita than smaller departments among the public institutions. There is not a clear pattern for size among the private institutions, but data for smaller private institutions is limited.

Figure GI. Teaching Assistantship Stipends
CRA Taulbee Survey 2018

## Graduate Student Support

(Tables GI-G2; Figures GI-G3)
Table Gl shows the number of doctoral students supported as full-time students as of fall 2017, further categorized as teaching assistants (TAs), research assistants (RAs), and full-support fellows. The table also shows the split between those on institutional vs. external funds. Table Gla shows similar data for supported master's students.

The average number of TAs on institutional funds among doctoral students in U.S. CS departments dropped slightly from last year's value, from 34.5 to 33.8. A similar decline was reported last year. Public universities reported a slight increase, while the average at private universities dropped considerably, from 35.2 to 24.6. The reported values at private universities have been somewhat volatile in recent years. Since there are fewer of them, compared with public universities, they are more sensitive to the specific units reporting in a given year. The small number of CE, I, and Canadian departments also make these comparative averages subject to volatility.

Among doctoral students, the average number of RAs on external funding was higher in U.S. CS departments at public universities and lower in those at private universities compared with last year's report, while the average number of RAs supported on institutional funds increased sharply at private universities and declined at publics. In both cases, these were the reverse situations from what was reported last year. The average number of full-support fellows on internal funds increased in U.S. CS departments at both public and private universities. The average number of full-support fellows on external funds increased at U.S. CS departments in public universities but fell in those at private universities.

Among master's students, 66.8 percent of support is for TAs, an increase over the 64.2 percent reported last year. Conversely, 29.8 percent of support is for RAs, lower than last year's 32.0 percent. Among the 97 U.S. CS departments that provided master's support data, the average number of TAs per department on institutional funds is 19.4, compared to the 16.7 average reported in last year's survey (Table Gla). This suggests that the use of master's students is increasing to help

Figure G2. Research Assistantship Stipends
CRA Taulbee Survey 2018

Figure G3. Full Support Fellows Stipends CRA Taulbee Survey 2018

departments cope with the CS enrollment surge. Note, however, that master's students are not eligible for assistantships in several departments (Table Glb).

Table G2 shows the distribution of stipends for TAs, RAs, and full-support fellows. U.S. CS data are further broken down in this table by public and private institution. Figures GI-G3 further break down the U.S. CS data by size of department and by geographic location of the university.

The median TA salaries at U.S. CS departments increased 2.7 percent at public universities and increased 6.1 percent at private universities. Median salaries of RAs rose 4.3 percent at public universities and 2.9 percent at private universities. For full-support fellows, median salaries rose 5.7 percent at U.S. public universities and 4.2 percent at U.S. private universities. The TA change at public universities is slightly below the change reported last year; each of the other increases at both public and private institutions is larger than the corresponding change reported last year.

Compared with public U.S. CS departments, median stipends are higher at private U.S. CS departments in each of the three stipend categories. Median stipends for TAs and RAs at U.S. I schools fall in between those at public and private U.S. CS departments. These relationships are unchanged from previous years. Median stipends for full-support fellows at I schools fell in between the public and private U.S. CS medians, as in previous years. However, there only were six U.S. I schools reporting fullsupport fellow stipends this year, versus nine last year.

At U.S. CS departments in public institutions, larger departments have higher salaries than do smaller departments for both TAs and RAs, except that the smallest public departments (those of size 15 or less) have higher TA (but not RA) stipends than those of size 16-25. Stipends in U.S. CS departments at private institutions do not exhibit a clear relationship based on department size for TAs, but for RAs, stipends are slightly higher at larger departments.

## 2018 Taulbee Survey (continued)

## Faculty Salaries

(Tables SI-S2l and Sla-S19a; Figures SI-S9)
Each department was asked to report individual (but anonymous) faculty salaries if possible; otherwise, the department was requested to provide the mean salary for each rank (full, associate, and assistant professors and non-tenure-track teaching faculty, research faculty, and post-doctorates) and the number of persons at each rank. The salaries are those in effect on January l, 2019 for U.S. departments; nine-month salaries are reported in U.S. dollars. For Canadian departments, twelve-month salaries are reported in Canadian dollars. Respondents were
asked to include salary supplements such as salary monies from endowed positions.
U.S. CS data are reported in Tables SI-S16 and in the box and whiskers diagrams. Data for CE, I, Canadian, and new Ph.D.s are reported in Tables SI7-S20. The tables and diagrams contain distributional data (first decile, quartiles, and ninth decile) computed from the department averages only. Thus, for example, a table row labeled " 50 " or the median line in a diagram is the median of the averages for the departments that reported within the stratum (the number of such departments reporting is shown in the "depts" row). Therefore, it is not a true median of all of the salaries.

## 2018 Taulbee Survey (continued)

We also report salary data for senior faculty based on time in rank, for more meaningful comparison of individual or departmental faculty salaries with national averages. We report associate professor salaries for time in rank of 7 years or less, and of more than 7 years. For full professors, we report time in rank of 7 years or less, 8 to 15 years, and more than 15 years.

Those departments reporting salary data were provided a summary report in December 2018. Those departments that provided individual salaries were additionally provided more
comprehensive distributional information based on these individual salaries. This year, 68 percent of those reporting salary data provided salaries at the individual level.

The remainder of this section summarizes the basic report provided in December 2018 to all departments that provided salary data.

Salaries at private institutions tend to be higher than those at public institutions for all faculty types (Tables S2 and S3). This pattern is consistent with data from previous years.

## 2018 Taulbee Survey (continued)

Computing Research Association

When viewed relative to faculty size (Figures Sl-S7), salaries tend to be higher for larger departments at both public and private institutions (perhaps best seen in Figures SI-S9). This pattern holds for all tenure-track ranks except at private institutions for a) full professors with 0-7 years in rank, and b) assistant professors. The pattern also holds for teaching faculty, research faculty and postdoc salaries.

When viewed relative to type of locale (also Figures S1-S7), public institution salaries appear to be generally lower in smaller locales than in mid-size or large cities for all tenure-track faculty ranks. Private institution salaries exhibit a less clear pattern.

Teaching faculty salaries at both public and private institutions generally are higher in large cities than in smaller locales.

Our analysis of faculty salary changes from one year to the next uses only those departments that reported both years; otherwise, the departments that reported during only one year can skew the comparison. Because some departments that reported both years provided only aggregate salaries for their full and associate professors during one year and in the other year reported them by years in rank, we only report salary changes for all full professors and for all associate professors in the year-to-year comparison. Table S2l shows, by type of faculty

## 2018 Taulbee Survey (continued)

and type of department, the change in the median of the average salaries from departments that reported both years (the number of departments being compared is indicated in parentheses in each column heading). Using the cell showing full professors at U.S. CS departments as an example, the table indicates that the median of the 130 average salaries for full professors was 3.1 percent higher in 2018 than was the median of the average full professor salaries in 2017 from these same 130 departments.

When interpreting these changes, it is important to remember the effect that promotions have on the departmental data from one year to the next, since a promotion causes an individual faculty member to move from one rank to another. Thus, a department with a small number of faculty members in a particular rank can have its average salary in that rank change appreciably (in either direction) by a single promotion to or from that rank. Departures via resignation or retirement also impact

## 2018 Taulbee Survey (continued)

these figures, particularly in the non-tenure-track categories. Because of the small number of Canadian, CE, and I departments reporting, the values in those columns are considerably more volatile; this is evident in several of the entries in Table S21.

For new Ph.D.s in tenure-track positions at U.S. CS, CE, and I school departments (Table S20) the median of the averages was $\$ 106,672$, an increase of 4.1 percent vs. last year. There was an insufficient response from Canadian institutions to report any results regarding Canadian salaries for new Ph.Ds.

This year, for the first time, we requested salaries for non-tenure-track teaching faculty separated into two classifications: Teaching Professors and Other Instructors, as described above. The salary data was further divided by years teaching at their current institution. The data for both classifications and all year ranges have been merged into a single "Teaching Faculty" entry in the main salary tables for comparability with previous years. This report adds figures showing box and whisker plots for all years combined for Teaching Professors (Figure S7a) and Other

## 2018 Taulbee Survey (continued)

Instructors (Figure S7b). In addition, there are supplemental salary tables Sla - SI9a that show the year-band breakdowns for each group. The salaries for the two categories show expected patterns: In general, salaries are higher for Teaching Professors than for Other Instructors (more so at private and large public institutions than at smaller public institutions), higher at private
than at public institutions, and higher with increased years of teaching at the institution

We may adjust the "years teaching" bands to broader year groupings for next year's data collection to reduce the number of cells with insufficient data to report.

## Department Profiles

Every three years, the Taulbee Survey collects data about elements of departmental activities that are not expected to change much from year to year. Included are data about teaching loads, sources of external funding, methods of recruiting graduate students, space, and department support staff. The most recent prior data about these activities were reported in the 2015 Taulbee Survey. The results of that survey are available on the CRA web site at https://cra.org/wp-content/ uploads/2016/05/2015-Taulbee-Survey.pdf.

## Teaching Loads

(Tables Profl-Prof4)
Across all departments, the median teaching load for tenuretrack faculty, as measured in semester courses per year, is 3.0. This median has not changed in a long time. The median load at
public U.S. CS departments and at Canadian departments also is 3.0, and that for U.S. I departments is 3.5 ; each of these values is unchanged from three years ago. The median load at private U.S. CS departments is 2.0; it was 3.0 three years ago but was 2.0 six years ago (Table Profla).

Teaching loads for Teaching Professors are contained in Table Proflb and for Other Instructors in Table Proflc. At U.S. CS departments at public institutions, the median load is 6.0 for both categories of teaching faculty, while the median load in U.S. CS departments at private institutions is between 5 and 6 for each category. U.S. I departments have a median of 6.0 for the Teaching Professors and 5.0 for Other Instructors.

Changes from the standard teaching load are possible for all types of departments and both tenure-track and teaching faculty. Reductions in load are possible in a greater percentage

of departments than are increases in load; however, load changes (in either direction) are less likely for teaching faculty than for tenure-track faculty in U.S. CS departments, and tend to be less likely for Other Instructors than for Teaching Professors (Table Prof2). Tables Prof3a, b, and c provide, for tenure-track, Teaching Professor, and Other Instructor faculty respectively, statistics on the percentage of departments that afford teaching load reductions for different types of activities. Tables Prof4a, b, and c give statistics about possible increases in the teaching load above the standard level.

## Sources of External Funding

(Table R2)
Table R2 shows a history of the sources of CS research funding, as reported every three years since 2003. Fewer departments provided this data in 2018, but the distribution is similar to previous years. NSF is by far the biggest funder of CS research, though its share of the total fell from 42.9 percent in 2015 to 38.3 percent in 2018. The share of CS funding from defense agencies including DARPA also fell in 2018, while industry funding and funding from unidentified other sources increased in percentage.

Table R2. Comparison of US CS External Funding 2003-2015.

## 2018 Taulbee Survey (continued)

Computing Research Association

## Other Graduate Student Data

(Tables Prof5-Prof7)

Table Prof5 indicates the factors that affect the amount of the stipend of graduate students. In aggregate across all types of departments, advancement to the next stage of the graduate program is again the most likely factor, with stipend source generally next most likely. This is similar to previous reports, although there is again a decrease in the percentage of reporting departments that modify stipends based on advancement in the program (44 percent vs 48 percent three years ago and 52 percent six years ago). Stipend source also was reported as less likely than three years ago (26 percent vs 37 percent).

Table Prof6 indicates the types of incentives provided when recruiting graduate students. Compared with three years ago, a somewhat smaller percentage of departments report offering guaranteed multi-year support (46 vs 51 percent) and guaranteed
summer support (17 vs 22 percent), while a somewhat higher percentage report offering paid campus visits (42 vs 37 percent). Table Prof7 indicates the median amounts reported for those that offered various recruiting incentives. The amount of signing bonuses was less than that reported three years ago, while the amounts of stipend enhancements and summer support was greater. Many fewer departments provided data this year than did three years ago (99 vs 172), so these comparisons must be interpreted with this in mind.

## Space

(Tables Prof8-Prof22)

Median total space at U.S. departments increased 12.5 percent over that reported three years ago. However, median office space and instructional lab space actually declined by 3 and 15 percent, respectively. Median research lab space increased three percent (Table Prof8).

Table Prof8. Department Space, net square feet, All US (132 Departments)

| Percentiles | Total <br> Space | Faculty, Staff, and <br> Student Offices | Conference and <br> Seminar Rooms | Research <br> Labs | Instructional <br> Labs |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 90 | 97,592 | 48,329 | 6,520 | 20,692 | 13,422 |

## 2018 Taulbee Survey (continued)

U.S. CS departments at public universities experienced a smaller three-year overall median space increase than did those at private universities ( 6 vs 20 percent). Median instructional lab space declined at both public and private universities, while median research lab space increased at public universities and declined at private universities (Tables Prof9 and Profi0). Small median space increases were present among U.S. I and Canadian departments (Tables Profl2 and Profi3). Too few CE departments reported to this year's survey to allow any reported values to be displayed (Table Profil).

A greater percentage of departments report definite plans to gain space in the near future than was the case three years
ago, and this is true in all types of departments (Table Prof14). Institutional funds, as usual, is the most likely source of funding for this increased space (Table Profl5).

Tables Prof16-Prof2l show in turn for the various department types, the distribution of space of each type, normalized for faculty size. Once again, there were too few CE departments reporting to display any values for that type of department. Table Prof22 shows the distribution of percentage of space (as opposed to amount of space as reported above) among the various space categories at U.S. departments. Thus, for example, half of the departments allocate 40 percent or more of their space to offices, and half allocate 40 percent or less space for offices.

Table Profi0. Department Space, net square feet, US CS Private (28 Departments)

| Percentiles | Total <br> Space | Faculty, Staff, and <br> Student Offices | Conference and <br> Seminar Rooms | Research <br> Labs | Instructional <br> Labs |

## Departmental Support Staff

(Tables Prof23-Prof28)
Tables Prof23-Prof28 show the distribution of department staff for the different department types. Across all institutions, there was an increase in the median number of administrative staff, from six reported in 2015 to seven reported in 2018, and an increase in the median number of research staff from one to two. The latter is a function of additional research support that is funding such staff. U.S. CS departments at private universities showed an increase in median staffing for all three types of
staff (administrative, computing, and research), while U.S. CS departments at public universities had a median staff decrease in computing support and little change in the other two staff categories. U.S. I departments, which mainly are l-schools, had much larger median staffing than did U.S. CS departments, and had an increase in the median administrative staff size from 19 to 27.5 over the past three years. There are two more such I departments reporting this year, and since the total number of such departments is 12 this year, these two departments can have a larger influence on medians than likely would be the case for CS departments.

## Concluding Observations

There still is no let-up in the undergraduate enrollment surge, which has resulted in more than a decade of sustained growth. Departments were successful in increasing teaching faculty above the level of enrollment increase this year; they also increased their average tenure-track faculty size and slightly increased the average number of TAs per department. While welcome, the overall growth in teaching capacity woefully lags the growth in students during the past eleven years, and the vast majority of departments report increased difficulty in managing the situation. There is no evidence that the enrollment growth has resulted in changes in teaching loads during the past three years. However, the number of students has been increasing in the typical introductory and mid-level course. The median course size of the typical mid-level course is 50 percent higher today than it was just three years ago. On top of the undergraduate enrollment growth, departmental research productivity has continued to increase and there has been another year of strong growth in the number of new students in doctoral programs. Departmental space has increased somewhat, but appears to have been directed mainly to support research growth rather than enrollment growth,

Gender diversity of degree recipients improved at all degree levels. However, in CS the representation of women would have to more than double in order to approach parity of representation with men among all U.S. students receiving bachelor's degrees. There is little change in ethnic diversity from year to year, where resident Asians are vastly over-represented and basically every other resident ethnic group (including Whites) is under-represented among CS bachelor's graduates relative to the population of U.S. bachelor's graduates.

It is remarkable how departments have been able to keep up their productivity. However, this year showed a marked increase in both the number of faculty who left for other faculty positions and the fraction of total faculty losses that were to faculty taking other academic positions. Whether this will become a trend is not clear, but it bears watching.

## Participating CS, CE, I and Canadian Departments

(Departments marked with * have participated in all 5 of the most recent Taulbee surveys)
U.S. CS Public (104): Arizona State*, Auburn*, Binghamton, Boise State, Clemson*, College of William \& Mary*, Colorado School of Mines*, Colorado State*, Florida International*, George Mason*, Georgia Tech*, Georgia State*, Indiana*, Indiana University Purdue University Indianapolis, Iowa State*, Kansas State*, Kent State*, Michigan State*, Michigan Technological University, Missouri University of Science and Technology, Montana State*, Naval Postgraduate School*, New Jersey Institute of Technology*, New Mexico State, North Carolina State*, North Dakota State*, Ohio State*, Ohio*, Oklahoma State*, Old Dominion, Oregon State, Pennsylvania State*, Portland State*, Purdue*, Rutgers*, Southern Illinois (Carbondale), Stony Brook (SUNY)*, Texas A\&M*, Texas Tech, University at Buffalo, Universities of: Alabama (Birmingham*), Arizona, Arkansas*, Arkansas at Little Rock*, California (Berkeley*, Davis*, Irvine*, Los Angeles, Riverside*, San Diego, Santa Barbara*, and Santa Cruz*), Central Florida*, Colorado (Boulder)*, Connecticut*, Delaware*, Florida*, Georgia*, Hawaii, Houston*, Idaho, Illinois (Chicago and UrbanaChampaign), Iowa*, Kansas*, Kentucky, Louisiana at Lafayette*, Maryland (College Park* and Baltimore County*), Massachusetts (Amherst*, Boston*, and Lowell), Memphis, Michigan*, Minnesota*, Nebraska (Omaha* and Lincoln*), Nevada (Las Vegas and Reno*), New Hampshire*, New Mexico, North Carolina (Chapel Hill* and Charlotte*), North Dakota, North Texas*, Oklahoma*, Oregon*, Rhode Island*, South Carolina*, South Florida*, Tennessee (Knoxville)*, Texas (Arlington, Austin*, Dallas*, and El Paso*), Utah*, Vermont, Virginia*, Washington*, Wisconsin (Madison* and Milwaukee), and Wyoming; Virginia Tech*, Washington State*, Wayne State*, and Wright State.
U.S. CS Private (39): Boston University*, Brandeis, Brown*, Carnegie Mellon*, Case Western Reserve*, Clarkson, Columbia, Cornell*, DePaul*, Drexel*, Duke*, Emory*, George Washington, Harvard, Illinois Institute of Technology, Johns Hopkins, Lehigh*, MIT*, New York University*, Northeastern*, Northwestern, NYU

## 2018 Taulbee Survey (continued)

Tandon School of Engineering, Princeton*, Rensselaer*, Rice, Rochester Institute of Technology*, Stanford*, Stevens Institute of Technology, Toyota Technological Institute at Chicago*, Tufts*, Universities of: Chicago*, Notre Dame, Pennsylvania*, Rochester*, Southern California*, and Tulsa*, Washington in St. Louis*, Worcester Polytechnic Institute*, and Yale.
U.S. CE (6): North Carolina State*, Northeastern*, Universities of: Central Florida*, Illinois (Urbana-Champaign), New Mexico*, and Southern California.
U.S. Information (15): Cornell*, Drexel*, Florida State, Indiana*, Penn State*, Syracuse, Universities of: California (Berkeley)*, Colorado (Boulder), Illinois (Urbana-Champaign), Maryland (College Park ISchool and Baltimore County*), Michigan*, North Carolina (Chapel Hill)*, Pittsburgh*, and Washington*.

Canadian (12): Concordia*, McGill, Simon Fraser*, Universities of: British Columbia*, Calgary*, Manitoba*, New Brunswick, Toronto*, Victoria*, Waterloo, Western Ontario*, and York*.
${ }^{1}$ The title of the survey honors Orrin E. Taulbee of the University of Pittsburgh, who conducted these surveys for the Computer Science Board until 1984, with retrospective annual data going back to 1970.
${ }^{2}$ Information (I) programs included here are Information Science, Information Systems, Information Technology, Informatics, and related disciplines with a strong computing component. Surveys were sent to CRA members, the CRA Deans group members, and participants in the iSchools Caucus (www.ischools.org) who met the criteria of granting Ph.D.s and being located in North America. Other I programs who meet these criteria and would like to participate in the survey in future years are invited to contact survey@cra.org for inclusion.
${ }^{3}$ Classification of the population of an institution's locale is in accordance with the Carnegie Classification database. Large cities are those with population $>=250,000$. Mid-size cities have population between 100,000 and 250,000. Town/rural populations are less than 100,000.
${ }^{4}$ All faculty tables: The survey makes no distinction between faculty specializing in CS vs. CE programs. Every effort is made to minimize the inclusion of faculty in electrical engineering who are not computer engineers.
