## By Stuart Zweben and Betsy Bizot

This article and the accompanying figures and tables present the results from the 50th annual CRA Taulbee Survey'. The survey, conducted annually by the Computing Research Association, documents trends in student enrollment, degree production, employment of graduates, and faculty salaries in academic units in the United States and Canada that grant the Ph.D. in computer science (CS), computer engineering (CE), or information (I)². Most of these academic units are departments, but some are colleges or schools of information or computing. In this report, we will use the term "department" to refer to the unit offering the program.

CRA gathers survey data during the fall. Responses received by February 22, 2021 are included in the analysis. The period covered by the data varies from table to table. Degree production and enrollment (Ph.D., Master's, and Bachelor's) refer to the previous academic year (2019-20). Data for new students in all categories refer to the current academic year (2020-21). Projected student production and information on faculty salaries are also for the current academic year; salaries are those effective January 1, 2021.

We surveyed a total of 279 Ph.D.-granting departments and received responses from 179, for an overall response rate of 64 percent. Last year we had two more total respondents and a 65 percent response rate. The response rates from CE and Canadian departments in particular continue to be low. The U.S. CS response rate of 78 percent is, as usual, the highest of all of the categories; it is slightly higher than last year's 77 percent and is typical of the response rates for the past decade. Figure 1 shows the history of the survey's response rates. Response rates are inexact because some departments provide only partial data, and some institutions provide a single joint response for multiple departments. Thus, in some tables the number of departments shown as reporting will not equal the overall total number of respondents shown in Figure 1 for that category of department.

To account for the changes in response rate, we will comment not only on aggregate totals but also on averages per department reporting or data from those departments that responded to both 2019 and 2020 surveys. This is a more meaningful indication of the one-year changes affecting the data.

Degree, enrollment, and faculty salary data for the U.S CS departments are stratified according to: a) whether the institution
is public or private; and b) the tenure-track faculty size of the reporting department. The faculty size strata deliberately overlap, so that data from most departments affect multiple strata. This may be especially useful to departments near the boundary of one stratum. Salary data is also stratified according to the population of the locale in which the institution is located ${ }^{3}$. These stratifications allow our readers to see multiple views of important data, and hopefully gain new insights from them. In addition to tabular presentations of data, we will use "box and whisker" diagrams to show medians, quartiles, and the range between the $10^{\text {th }}$ and $90^{\text {th }}$ percentile data points.

This year's survey was conducted in the middle of the COVID-19 pandemic. With institutions closed for part of 2019-20, varying approaches to learning once classes resumed in Spring 2020, and the fact that these educational decisions persisted in the 2020-21 academic year, the data we report here should be interpreted with appropriate COVID-related caveats. This is particularly true of comparisons with prior years. We asked special questions this year to gain some appreciation for the effect of these educational adjustments on new student enrollment in 2020-21. Those results are included in this report where they naturally fall, e.g., changes in new Ph.D. student enrollment are reported with the usual data on new Ph.D. students. In the Concluding Observations section, we summarize where we think this year's reported data was particularly affected by COVID-19. Other insights into department experiences were obtained by two special surveys conducted by CRA in early summer 2020, one of individual faculty and one of chairs or other department representatives; those results are available from the Data tab of the CRA website https://cra.org/.

We thank all of the respondents to this year's questionnaire, and especially appreciate their willingness to provide data during such an unusual and trying time. The participating departments are listed at the end of this article. CRA member respondents
will again be given the opportunity to obtain certain survey information for a self-selected peer group. Instructions for doing this will be emailed to all such departments.

Figure 1. Number of Respondents to the Taulbee Survey

| Year | US CS Depts. | US CE Depts. | Canadian | US Information | Total |

## Doctoral Degree Production, Enrollment, and Employment

(Tables I, DI-DIO; Figures DI-D6)

## Degree Production

Doctoral degree production was higher in 2019-20 than in 2018-19 despite fewer departments reporting. This year's respondents produced 14.2 degrees per U.S. CS department, and 13.4 degrees per department overall. This compares with 13.2 and 12.2 , respectively,
reported last year. Only 149 departments reported their Ph.D. production this year, compared with 160 last year. The 149 departments produced 1,997 Ph.D.s in 2019-20, compared with 1,860 degrees produced in 2018-19 by the 160 departments (Table DI).

Among all departments reporting both this year and last year, the number of total doctoral degrees rose by 5.9 percent. Among U.S. CS departments reporting both years, the increase was 4.4 percent (Table I).

In 2019-20, 19.9 percent of CS doctoral degree recipients were female, and 21.7 percent of all doctoral computing degree recipients were female (Table D2). The respective percentages in 2018-19 were 20.3 and 20.8. Non-resident Aliens comprised a higher percentage of 2018-20 Ph.D. recipients in all three areas (CS, CE and I) compared with 2018-19 recipients. This is the reverse of what was experienced last year, but last year's experience was the reverse of that from two years ago. In contrast, resident Asians comprised a smaller percentage of 2019-20 graduates compared with 2018-19 among recipients in all three areas (Table D3), again the reverse of what last year's data showed. The combined percentage of CS doctoral graduates who were American Indian or Alaska Native, Black or African American, Native Hawaiian/Pacific Islander, Hispanic, or Multiracial Non-Hispanic was 3.8 percent, the same as it was two years prior; it was 3.1 percent in 2018-19.

Also similar to two years ago, Non-resident Aliens had a higher percentage of female than male CS graduates, while Whites had a higher percentage of male than female CS graduates (Table D9). In 2018-19, Non-resident Aliens comprised a somewhat smaller percentage of the CS female doctoral graduates than they did CS male graduates, and Whites comprised an equal percentage of the female and male graduates.

## Doctoral Program Enrollment

Total doctoral enrollment increased by 7.9 percent, and increased 6.8 percent among programs that reported both years. If only U.S. computer science departments are considered, the respective increases were 5.2 and 6.6 percent (Table I). In each case, the percent increases are higher than last year when all departments are considered, and lower when only departments that reported both years are considered.

The fraction of females among enrolled students rose for the fifth straight year, but only slightly, Across the three areas of CS, CE and I combined, the fraction of females among 2019-20 doctoral students was 24.8 percent, versus 24.5 percent in 2018-19. In CS, females comprised 23.4 percent of the 2019-20 students currently enrolled, versus 23.2 percent the previous year (Table D7).

Doctoral enrollment diversity by race/ethnicity rebounded in 2019-20. The overall fraction of doctoral students who were neither Non-resident Aliens, Asian, nor White was 6.2 percent; it was 4.9 percent in 2018-19 and 6.9 percent the previous year. In CS programs, the fraction rose to 6.0 percent from 4.5 percent in 2018-19 and 7.0 percent the previous year (Table D8).

Non-resident Aliens comprise a higher percentage of the enrolled female CS students than they do the enrolled CS male students,

## 2020 Taulbee Survey (continued)

while a lower percentage of enrolled CS females than enrolled CS males are White. The same relationships hold for CE. In I, the same pattern holds for White students (they comprise a lower percentage of female I students than of male I students), but Non-resident Aliens also comprise a smaller percentage of enrolled female I students than of enrolled male I students (Table DIO). All of these relationships are consistent with last year's data.

At U.S. CS departments, the average number of students per department who passed qualifier exams in 2019-20 declined to 16.3 from last year's reported 17.0. For the second straight year, both public and private institutions reported declines. The average number per U.S. CS department who passed thesis candidacy exams in 2019-20 (most, but not all, departments have such exams) also declined from its 2018-19 level at public institutions, but increased at private institutions (Table DI).

The number of new Ph.D. students per U.S. CS department declined this year compared with last year's reporting departments for departments at both public and private institutions, and in all three disciplines. U.S. I departments reported a slight increase, and Canadian departments also reported an increase in new students per department. Among departments that reported both years, the number of new Ph.D.
students declined by 11.8 percent overall and 13.2 percent among U.S. CS departments (Tables 1 and D5).

The proportion of new doctoral students from outside North America declined quite a bit this year to $51.9 \%$ from $61.2 \%$ last year. The declines were at U.S. CS and U.S. CE departments, while there were increases at Canadian departments and slight increases at

U.S. I departments (Table D5a). These changes, coupled with the changes observed in the previous paragraph, suggest that the declines in new doctoral enrollment are largely attributable to declines in students from outside North America. There are likely components of this decline due to U.S. immigration policy and components related to the COVID pandemic.

We added two questions this year to try to capture the effect of pandemic-related choices on new doctoral student enrollment. First, we asked how many students newly admitted for fall 2020 had deferred enrollment to 2021. Departments reported an average of 9 deferrals, compared to an average of 20 new doctoral students per department. We would expect some number of students to defer enrollment for a year in more usual times, but since we have no baseline on deferrals, it is hard to interpret this reported number except to say that it seems high as a percentage of the average number of new students.

Second, there was concern that international students might change their plans at the last moment due to some combination of the pandemic and/or visa issues. We therefore asked for a number of international students who were expected in the fall but did not arrive. Departments reported 690 international CS students who did not arrive, compared to 1,479 international CS students newly enrolled Perhaps some of these students who did not arrive still could be enrolled as new students, but we did not ask that question. In any case, it is clear but not surprising that the plans of a large fraction of the new international students were affected by the pandemic.

Figure D5 shows a graphical view of the Ph.D. pipeline for U.S. computer science and Canadian departments, the main producers of CS doctoral degrees. The data in this graph are normalized by the number of reporting departments. The graph offsets the qualifier data by two years from the data for new
Table DI3. New PhD Enrollment by Gender and Ethnicity, From 150 Departments

## 2020 Taulbee Survey (continued)

students, and offsets the graduation data by five years from the data for new students. These data have been useful in estimating the timing of changes in production rates. The graph predicts continued growth in Ph.D. production next year, and departments are forecasting an increase in production during 2020-21 (Table DI). Based on past experience, the amount of the increase tends to be less than departments estimate.

## Ph.D. Employment

Figure D6 shows the employment trend of new Ph.D.s in academia and industry within North America, those taking employment outside of North America, and those going to academia in North America who took positions in departments other than Ph.D.-granting CS and CE departments. Table D4 shows a more detailed breakdown of the employment data for new Ph.D.s. The percentage of new Ph.D.s who took positions in North American industry was 56.4 percent, down slightly from the 57.0 percentage reported last year. Among those doctoral graduates who went to North American industry and for whom the type of industry position was known, about 57 percent took research positions (Table D4a), compared with 63 percent who did so last year. This year, definitive data was provided for over 93 percent of the graduates who went to North American industry, an improvement over last year's 90 percent.

The percentage of Ph.D. graduates who took North American academic jobs in 2019-20 (30.0) also was somewhat below that reported for 2018-19 (31.5). Among those graduates taking academic positions in North America, the percentage who did not go to a doctoral-granting computing department was 6.3, compared to 8.9 in 2018-19. This number has oscillated for the last several years.

Among those whose employment is known, 10.2 percent of Ph.D. graduates reported taking positions outside of North America, the highest percentage in nearly a decade. A smaller percentage of these graduates went to an industry position than did so last year, while a larger percentage went to some kind a tenure-track or research position in a doctoral-granting institution. Definitive data was provided for 86 percent of the graduates who went to non-North American industry positions, a drop from the 93 percent reported last year.

When academic and industry postdocs are combined, the result is that 13.2 percent of 2019-20 doctoral graduates whose employment was known took some type of postdoctoral position. Last year, the reported percentage was 15.0. Approximately eight percent of these were industry postdocs, as was the case last year.

Of those doctoral graduates for whom employment information was known, six reported as unemployed. However, 31.5 percent of new Ph.D.s' employment status was unknown, higher than the 26.8 percent reported last year. The lack of information about the employment of more than one in four graduates may skew the real overall percentages for certain employment categories.

Table D4 also indicates the areas of specialty of new Ph.D.S. artificial intelligence/machine learning continues to be by far the most popular area, comprising nearly 19 percent of all doctoral degrees awarded for which the area was known. However, this year, software engineering, security/information assurance, theory/algorithms, and human-computer interaction followed, in that order. Human-computer interaction replaced robotics/vision in the top five this year. Slightly more than one in five of the Ph.D.s are categorized into the area "unknown", a similar fraction as last year.

## Master's and Bachelor's Degree Production and Enrollments

This section reports data about enrollment and degree production for master's and bachelor's programs in the doctoralgranting departments. Although the absolute number of degrees and enrolled students reported herein only reflect departments that offer the doctoral degree, the trends observed in the master's and bachelor's data from these departments tend to strongly reflect trends in the larger population of programs that offer such degrees.

## Master's

(Tables MI-M8; Figures MI-M2)
On a per department basis, 2019-20 CS master's degree production in U.S. CS departments rose by 3.3 percent compared with 2018-19. The production at public institutions rose 8.9 percent, while that at private institutions declined by 2.7 percent. Each of these comparisons is in the same direction of the year-to-year comparison reported in last year's survey, although the absolute values of each comparison are smaller than those reported last year.

Overall master's degree production per department in 2019-20 rose 6.5 percent aggregated over all departments, 3.5 percent at
U.S. CS departments and 6.5 percent at Information departments. Canadian production per department showed a large decrease following a large increase reported last year, but a small number of Canadian departments reported, and this comparison may well be skewed by the difference in departments reporting in the two respective years. No comparison is made for the CE area due to the even smaller number of departments reporting (Table MI).

The proportion of female graduates among CS master's degree recipients declined from 27.2 percent to 26.6 percent. Among CE graduates, 29.9 percent were female, up from 24.6 percent, and the I area again had more female than male graduates among those whose gender was reported (50.7 percent, though down from 53.9 percent in last year's report). Aggregating all areas, the percentage of master's degree graduates who were female increased from 31.2 to 31.4 percent (Table M2).

In CS, 66.8 percent of master's degrees went to Non-resident Aliens compared with 68.9 percent in 2018-19. The percentage of Non-resident Aliens also dropped in the I area, from 43.3 percent to 41.0 percent. The CE area statistics can be volatile due to the smaller number of units reporting; however, the percentage of CE degrees going to Non-resident Aliens changed only slightly, from 79.8 to 78.4 percent. The aggregate percentage over all three areas fell from 64.9 to 62.3 percent. The percentage of CS

| Grand Total | 40,285 | 143 | 281.7 | 1,783 | 29 | 61.5 | 9,210 | 35 | 263.1 | 51,278 | 160 | 320.5 |

master's recipients among the combined American Indian/Alaska Native, Black/African-American, Native Hawaiian/Pacific Islander, Hispanic, and Multiracial categories rose to 5.0 percent in 201920 from 3.9 percent in 2018-19 (Table M3).

Non-resident Aliens again comprised a much larger proportion of female CS and CE degree recipients than male CS and CE degree recipients, while larger percentage of male CS and CE degree recipients than female CS and CE degree recipients were White (Table M7). In the I area, Non-resident Aliens again comprised a larger percentage of male master's graduates than female master's graduates, while a smaller percentage of male master's graduates than female master's graduates were White. These relationships have existed for several years, and are likely to continue into the near future based on the current enrollment breakdown by gender and ethnicity (Table M8).

The average number of new master's students enrolled in U.S. CS departments fell substantially, from 118.1 to 99.5. The decline is in departments at both public and private institutions (Table M5). This decline appears to be almost entirely due to students who are from outside North America. The fraction of new master's students in U.S. CS departments that is reported to be from outside North America in 2020-21 was 44.7 percent, compared with 63.1 percent in 2018-19 (Table M5).
U.S. Information departments and Canadian departments also experienced a sizeable decline in the fraction of new master's students from outside North America. in U.S. I departments,
the percentage dropped from 43.4 to 25.8, while in Canadian departments, it dropped from 66.5 to 30.6

Comparable to the questions about new doctoral students, we added two questions this year to try to capture the effect of the pandemic on new master's student enrollment. First, we asked how many students newly admitted for fall 2020 deferred enrollment to 2021. Departments reported an average of 72 deferrals among newly admitted CS master's students, compared to an average of 90 new CS masters students per department. As was the case with new doctoral students, the deferrals seem high as a percentage of the average number of new students.

We also asked for a number of international students who were expected in the fall but did not arrive. Departments reported 4,429 international master's students who did not arrive, compared to 6,701 international CS students newly enrolled. Clearly, the COVID situation affected plans of a large fraction of international master's students, as it did for the international doctoral students.

It is worth observing that CS declines in new student enrollment were present at both the master's and doctoral levels, while I departments and Canadian departments experienced declines only at the master's level. It will be interesting to see what kind of rebound occurs to the international graduate student population once the COVID pandemic's influence on foreign travel abates. Changes to U.S. immigration policy also will have an impact on any such rebound.
Table M7. Master's Degrees Awarded by Gender and Ethnicity, From 160 Departments

## Bachelor's

(Tables I, BI-B8; Figures BI-B4)
Growth in bachelor's degree production was at double-digit percentage levels for the sixth straight year, Total degrees produced across all three areas of computing was 13.0 percent higher among this year's reporting departments compared with last year's reporting departments. The increase in CS degrees produced was 15.7 percent. On a per-department basis,
total degree production rose overall by 18.2 percent across all department types and 19.2 percent in U.S. CS departments. Total computer science degree production in U.S. CS departments rose 16.6 percent, and 20.2 percent per department. When considering only those departments that reported both years, the increase in total degree production across the CS, CE and I areas was 12.7 percent among all departments and 13.1 percent among U.S. CS departments (Tables I and BI).

Figure Bl shows the trend in total CS and CE bachelor's degree production since 1995 for all departments reporting to the Taulbee Survey. Based on current and recent enrollments, CS bachelor's degree production seems likely to continue its upward trend next year, although based on department forecasts this growth should be modest (Table B4). However, it should be noted that actual bachelor's degree production far exceeded last year's departmental projections.

Gender diversity among bachelor's graduates remained the same when aggregated over all three disciplines, and declined slightly in CS. Among all graduates whose gender was known, 21.5 percent were female in both 2018-19 and 2019-20. Among CS graduates whose gender was known, the percentages were 21.0 percent in 2018-19 and 20.6 percent in 2019-20. The percentage of I graduates who were female increased, from 27.8 percent to 29.4 percent, and the percentage of CE bachelor's graduates who were female increased from 14.6 percent to 16.6 percent.

Both the CS and I areas had a larger number of graduates whose gender is unknown than was the case last year (Table B2).

The percentage of CS bachelor's graduates who are White continued to decline, from 43.7 percent in 2018-19 to 40.7 percent in 2019-20. The percentage awarded to Asians and Non-resident Aliens again rose, from 27.0 percent to 28.8 percent for Asians and from 14.5 percent to 15.2 percent for Non-resident Aliens. All other ethnicities combined comprise 15.4 percent of those for whom ethnicity is known, up from 14.9 percent last year. Hispanics make up the largest share of these other ethnicities at 8.5 percent. In aggregate across the three areas of computing, 41.7 percent of the graduates were White, 27.1 percent Asian, 14.4 percent Non-resident Aliens, and 16.7 percent all other ethnicity categories combined. However, in I programs, the other ethnicity categories accounted for approximately 24 percent of the graduates, down from 25 percent last year (Table B3).

The total reported count of new undergraduate computing majors across the three disciplines increased 2.2 percent in 2020-21, and overall new majors per department increased by 6.8 percent. In U.S. CS departments, the overall count of majors across the three disciplines decreased by 3.0 percent as fewer departments reported this year. On a per department basis, new majors increased by 3.0 percent at U.S. CS departments.

In CS, the overall count of new majors across all department types declined by 4.7 percent, while new majors per department rose by 8.2 percent across all department types, and rose by 2.1 percent at U.S. CS departments. By contrast, in the I area, the overall count of new majors across all department types increased 42.3 percent, and the majors per department increased 27.7 percent (Table B5).

When only departments reporting both this year and last year are considered, the count of new majors decreased by 5.5 percent across all departments, and decreased 7.9 percent at U.S. CS departments. This is the second straight year of such decreases among departments reporting in consecutive years (Table I). Figure B2 illustrates the trend in the total number of newly declared computing undergraduate majors as reported in the Taulbee Survey.

Total enrollment in the major continued to grow. At U.S. CS departments, the total number of majors in CS, CE, and I combined increased 4.8 percent, while among all departments
it increased 2.9 percent. However, when normalized for the number of departments reporting, enrollment rose 10.5 percent at U.S. CS departments and 9.0 percent among all departments. U.S. CS department enrollments grew at both public and private institutions, but the growth was much stronger at public institutions. When only departments reporting both years are considered, the enrollment increases are 6.8 when all departments are considered, and 6.6 percent when only U.S. CS departments are considered (Table 1).

Looking only at CS enrollment, the increase in majors per department reporting is 6.9 percent for all departments combined, and 9.0 percent for U.S. CS departments. The U.S. CS growth is at departments in public institutions, while private institutions show a relatively flat average enrollment (Table B6).

Per-department averages smooth out comparisons from year to year when there are differences in the number of reporting departments, but these averages include both very large and very small departments. Figures B3 and B4 show the distribution of number of degrees awarded (Figure B3) and total enrollment (Figure B4) per tenured or tenure-track faculty member, in department size groupings for the U.S. CS departments. Neither public nor private institutions show a clear relationship between faculty size and either degree production per tenure-track faculty member or enrollment per tenure-track faculty member.

Figure B5 shows the enrollment trend from Taulbee Survey data since this surge began. It illustrates both the relatively flat number of average new majors per department since 2018 and the thirteen consecutive years of growth in average total majors per department through academic year 2019-20. The average enrollment per U.S. CS department increased over 400 percent during that period; that is more than a quintupling from its level in fall 2006. For the past seven years, it has exceeded the previous peak reached during the dot-com enrollment surge, and Is now more than two and a half times that peak.

Another view of bachelor's enrollments can be gleaned from CS course-level data. Such data was first reported in CRA's Generation-CS report for the fall terms in 2005, 2010 and 2015. The Taulbee Survey began collecting follow-up data in the 2016 survey, and now does so annually. Table B9 shows four-year

* BHN = Black or African-American, Hispanic/Latinx, or Native American/Indigenous
enrollment trends for the four types of courses for which data is collected (representative introductory course for non-majors, introductory course for majors, mid-level course, and upper-level course). For each type of course, only those departments are included that reported data for each of the four years and reported on the same course in each of the four years. The data indicate that median enrollment in the introductory course for non-majors, the introductory course for CS majors, and the mid-level course each is at its highest level in 2018 among the four years 2017-20. None of the courses show a steadily increasing median over the four-year period and only the upper-level course shows an increased median enrollment for 2020 compared with 2019. The table further shows that, with respect to the course for majors at the introductory, mid and upper levels, the median percent of majors in the course was higher in 2020 than in 2019 at the introductory and mid-level, but slightly lower at the upper-level. For the introductory course for majors, the median percentage of students who are majors is at its highest level In 2020 for the four-year period. The median representation of women in the introductory courses for majors is lower than in 2019, but the representation is higher than in 2019 in the other three courses. The median representation of students
from domestic Black, Hispanic/Latinx, and Native American/ Indigenous race/ethnicity classes is higher in 2020 compared with 2019 in all three courses for majors, and slightly lower in the Introductory course for non-majors.

Gender distributions of enrolled students suggest that a similar fraction of the total CS enrollment in 2020-21 is female as compared with 2019-20 (20.9 percent vs 20.8 percent). With respect to racial/ethnic diversity, the fraction of total enrollment aggregated across all three computing areas, among races/ ethnicities other than Non-resident Alien, Asian and White, is 22.3 percent. Last year it was 20.2 percent. In CS, these other races/ ethnicities comprised 21.3 percent of total enrollment, up from 19.3 percent last year (Table B8).

In all three computing areas (CS, CE, and I), Resident Asians and Non-resident Aliens again comprise a larger fraction of female enrollment than male enrollment, while a larger fraction of male enrollment than female enrollment is White (Table B8). Table B7 indicates that the same comparisons continue to hold true for degree awardees in CS and I. This year Non-resident Aliens are an equal fraction of male and female CE awardees.

## Faculty Demographics

(Tables FI-F9; Figure FI)4
Table Fl shows the current (2020-21) and anticipated sizes, in FTE, for tenure-track, teaching, and research faculty, and postdocs. Teaching faculty are separately reported in subcategories called "Teaching Professors" and "Other Instructors". "Teaching Professors" on average have more varied responsibilities in teaching, scholarship, service/governance, etc., and higher expectations for visibility outside the unit or the institution. "Other Instructors" are more focused on teaching introductory or mid-level courses and tend to have shorter contract lengths, though they are still full-time faculty (Taulbee does not collect data on course-by-course adjuncts other than typical course stipends; see the section on faculty salaries).

The total tenure-track faculty count in U.S. CS departments increased by 1.8 percent over last year, and the average tenuretrack faculty size increased by 4 percent. In U.S. CS departments, the total teaching faculty count increased by 25.2 percent, the third straight year of double-digit percent increase and the largest among the three years. The average increase per
department was even greater. The increases were greater in the Teaching Professors category than in the Other Instructor category of teaching faculty.
U.S. CS departments in both public and private institutions now have decidedly more Teaching Professors than Other Instructors. Historically, this has been true at private institutions while public institutions had a more even split. U.S. CE, U.S. I, and Canadian departments also reported a preference for the Teaching Professor category of teaching faculty.

Research faculty and postdocs each experienced sizeable reduction in 2020-21. The average number of research faculty reported at U.S. CS departments dropped from 2.8 to 2.0, while the total number of postdocs dropped from 3.7 to 3.1. Only about one-third of the U.S. CS departments providing faculty data to this year's survey reported having any research faculty; departments at private universities were more likely than those at public universities to have research faculty ( 40 percent vs 30 percent). About 41 percent of public and $50 \%$ of private U.S. CS departments reported having any postdocs.

Departments seem to be balancing two opposing influences on faculty size. There is still a need in many departments for more faculty to support continuing undergraduate enrollment growth, but on the other hand the impact of COVID-19 on budgets has created some hiring freezes. Although departments still anticipate faculty growth, the projected two-year growth in tenure-track size overall, which has been between 10 and 11 percent since 2016, was projected to be $7.5 \%$ this year. The projected two-year growth in Teaching Professors, which was between 19 and 20 percent in 2018 and 2019, dropped to $11.5 \%$. On the other hand, the projected twoyear growth in Other Instructors increased from $11.0 \%$ in 2019 to $14.6 \%$ in 2020. Projected two-year growth in Non-tenuretrack Research Faculty jumped from 12.9\% in 2019 to 30.1\% in 2020, perhaps compensating for the reduction in research faculty size this year.

Figure Fl illustrates the comparative changes at U.S. CS departments in undergraduate enrollment, tenure-track faculty and teaching faculty since 2006, when the current enrollment surge began. This figure updates with recent years' data a figure from the Generation-CS report. The graph shows that teaching faculty increases for the past three years have kept pace with and this year outpaced the rate of growth in the number of majors. However, since the enrollment surge began, the cumulative growth in teaching faculty is only about half that of the growth in majors. During the same period, tenuretrack faculty size has increased by only about 40 percent.

Canadian departments, on average, are larger than U.S. CS departments, in terms of both tenure-track and total faculty. Among U.S. CS departments, those at private universities are on average larger than those at public universities in both tenure-track and total faculty size. These relationships have been observed consistently for many years.

This year's reporting U.S. departments have, on average, similar total sizes to the average size reported last year; the CE totals are most heavily influenced by the small number of and specific departments reporting. The observations about U.S. CE and I departments may reflect the fact that we ask departments to report only computing-related faculty, so departments with Library Science or EE programs may report only part of their faculty.

Table F2 summarizes faculty hiring this past year. The success rate for hiring tenure-track faculty at this year's reporting U.S. CS departments was 76.7 percent, a considerable increase from last year's reported 70.7 percent and more comparable to the 77.5 percent rate reported two years ago. The success rate among departments at public universities was again higher than that at private universities ( 78.9 percent vs 69.7 percent), but both types
of departments enjoyed an improved success rate. Canadian departments once again collectively had a lower success rate than U.S.CS departments. U.S. I departments' success rate was in between those of U.S. CS and Canadian departments. In aggregate across all types of departments, the tenure-track hiring success rate was 74.1 percent, compared to 70.4 percent in last year's report. The distribution of the reasons for lack of

hiring success had some noticeable differences from last year. More instances of a position being "technically vacant and not filled for administrative reasons" were reported ( 12.2 percent of all cases vs 4.8 percent last year). This can happen, for example, when a position was supposed to be filled but approval to

Table F5. Faculty Losses

make an offer would not be given. Considerably more cases were classified by respondents as "other" ( 88.2 percent vs 2.8 percent last year) and among these, most of the reasons given were COVID related. Suffice it to say that the uncertainties related to COVID (financial and otherwise) impacted faculty hiring for the 2021 academic year (Table F2a).

Although the success rate for hiring tenure-track faculty improved from last year, the total number of new tenure-track hires in all reporting departments, which had been steadily increasing since at least 2016, decreased from 422 in 2019 to 374 in 2020. As part of our COVID impact questions, we asked departments how many new hires deferred arrival; they reported that 37 deferred to January 2021 and 44 deferred to fall 2021. While some new hires will defer arrival under normal circumstances, we expect this is higher than usual, and these

deferrals represent successful searches without newly hired faculty being in place in fall 2020.

Gender diversity among newly hired faculty again improved in 2020-21 when all categories of academic positions (tenure-track, teaching faculty, research faculty, and postdoc) are considered collectively. This year the fraction of females among newly hired faculty is 28.5 percent vs 25.9 percent last year (Table F3). Among those newly hired into tenure-track positions, the proportion who are female improved to 26.4 percent this year from 23.6 percent last year. As has been the case for the past few years, the percentage of females among new tenure-track faculty hires and the corresponding percentage among newly hired faculty overall both are higher than the percentage of females among new Ph.D.s produced during the past year (21.7 percent).

Among new tenure-track faculty whose residency is known, White, Non-resident Alien or Asian hires collectively comprise 89.4 percent. Among newly hired teaching faculty, these three categories comprise approximately $3 / 4$ to $4 / 5$ of the new hires, while among research faculty it is about 94 percent and among postdocs it is about 85 percent (Table F4).

Table Fl0 shows the sources of new faculty of each type. For newly hired assistant professors, the fraction who had been postdocs in the previous year was about 28 percent, the same as was reported last year. Since we began collecting such information in 2015, this percentage has ranged from 21 to 31 percent. About 30 percent of new assistant professors were new Ph.Ds, while about one-third of new assistant professors were in other academic positions the previous year. We don't know the previous academic rank of the new assistant professors
who came from other academic positions; they might have been teaching faculty or research faculty as a transitional position, or they might have come from other tenure-track positions.

Among senior faculty hires, only 53 had information about their previous position reported this year; last year we had data about 90 such persons, Of this year's new senior hires, 68 percent came from other academic institutions and 17 percent from industry. Last year's data favored other academic institutions by an even wider margin. Among Teaching Professors, only 17 percent were hired without a Ph.D, while this fraction was 52 percent for Other Instructors. Last year's respective percentages were 35 and 42 percent. This year, 33 percent of new research faculty did not have a Ph.D., compared with 55 percent reported last year, but comparable to the 34 percent reported two years ago.

There were 4.6 percent fewer faculty losses reported this year as compared with last year (Table F5). While there was an increase in the number of deaths, there was a substantial decrease in those who left for academic positions elsewhere and a lesser decrease in those who retired or took nonacademic positions. The COVIDrelated reasons for lack of hiring success discussed earlier may be related to this decline in faculty mobility.

The proportion of tenure-track faculty who are female is higher this year than last year, at all three ranks. The proportion of research faculty who are female also is slightly higher than it was last year but the proportion of postdocs who are female is lower than it was last year (Table F6).

Table F7 shows the breakdown of race/ethnicity among current faculty in each category. The proportion of current faculty

who are American Indian, Black, Native Hawaiian, Multiracial or Hispanic collectively totals between 3.8 and 6.3 percent except for the two categories of teaching faculty, where these ethnicities total 7.7 for Teaching Professors and 9.7 percent for Other Instructors.

Again this year, the vast majority of departments reported gender by race/ethnicity breakdowns of their faculty, Table F8 shows, for each race/ethnicity category within each computing area, the percentage of total male tenure-track faculty in that area represented by that category, and the percentage of total female tenure-track faculty in that area represented by that category. Tables F9a and F9b do likewise, respectively, for teaching faculty and for research faculty and postdocs. The biggest change from last year in the tenure-track faculty table is that, a larger percentage of female associate professors are Asian (40 vs 35 percent) and a smaller percentage are White (49 vs 57 percent) this year. Among teaching faculty, a greater
proportion of both male and female Other Instructors are White, and a smaller proportion of both genders are Non-resident Alien compared with last year.
U.S. CS departments anticipate an overall 4.5 percent growth in tenure-track faculty next year but a 6.3 percent growth in teaching faculty, with the growth expectations being largest in the Other Instructors category of teaching faculty (Table FI). Both the tenure-track and aggregate teaching faculty forecasts are lower than those made last year. Departments also forecast an overall 17.9 percent growth in postdocs, much higher than the forecast last year. Last year, departments considerably overestimated hiring in the tenure-track, research faculty and postdoc categories, and considerably underestimated hiring in each of the teaching faculty categories. Departments at private universities, however, came very close to actuals with regard to total teaching faculty.

## Research Expenditures

(Table RI; Figures RI-R2)
Table Rl shows the distribution of departments' total research expenditure (including indirect costs or "overhead" as stated on project budgets) from external sources of support. Figures Rl and R2 show the per capita expenditure, where capitation is computed two ways. The first (Figure RI) is relative only to the number of tenure-track faculty members. The second (Figure R2) is relative to research faculty and postdocs as well as tenuretrack faculty. Canadian levels are shown in Canadian dollars.

Reported research expenditures in U.S. departments were mixed during the past year. Overall median research expenditures for 2019-20 at U.S. CS public departments decreased 1.6 percent,
while they increased 11.5 percent at U.S. CS private departments and 6.1 percent at U.S. I departments. In last year's report, all categories of U.S. departments had a decrease. Canadian departments showed a 46 percent increase in median expenditure over last year, the second year in a row of a hefty increase, but the small Canadian sample size makes these comparisons a less reliable indicator of the country-wide situation.

The U.S. CS data show a tendency for larger departments to have more external funding per capita than smaller departments among both public and private institutions. This has been the trend consistently at public institutions, but not as consistently at private institutions.

## 2020 Taulbee Survey (continued)

Figure R1. Research Expenditures Normalized by Tenure-Track Size CRA Taulbee Survey 2020

Figure R2. Research Expenditures Normalized by Tenure-Track + Research Faculty + Postdoctorates CRA Taulbee Survey 2020

## Graduate Student Support

(Tables GI-G2; Figures GI-G3)
Table Gl shows the number of doctoral students supported as full-time students as of fall 2020, further categorized as teaching assistants (TAs), research assistants (RAs), and full-support fellows. The table also shows the split between those on institutional vs. external funds. Table Gla shows similar data for supported master's students.

The average number of TAs on institutional funds among doctoral students in U.S. CS departments dropped slightly from last year's value ( 33.5 vs 35.0 last year). Public universities reported a slight increase, and private universities reported a slight decrease. The small number of CE, I, and Canadian departments make their comparative averages subject to considerable volatility.

Among research associates, the average number per department on external funding in U.S. CS departments was similar to that
reported last year at both public and private universities, while the average number of RAs supported on institutional funds was similar at public universities but was sharply lower at private universities. The average number of full-support fellows on internal funds declined slightly in U.S. CS departments at public universities, but increased slightly at private universities. The average number of full-support fellows on external funds showed the same pattern as with internal funds.

Among master's students, 66.2 percent of support is for TAs, compared with 67.9 reported last year. Conversely, 31.3 percent of support is for RAs, compared with last year's 29.2 percent. The remaining 2.5 percent ( 2.9 percent last year) were fullsupport fellows.

Ten fewer U.S. CS departments provided master's support data than did so last year. Mainly the decrease was among departments at private institutions. Those that reported

this year had an average number of TAs per department on institutional funds of 22.1, compared to the 23.2 average reported in last year's survey and 19.4 reported two years ago (Table Gla). Departments in public institutions reported a decrease in TA support, from an average of 23.2 to 20.8, while departments in private institutions had an average of 29.4 vs 23.2 last year. The specific reporting departments from private institutions may be the major cause of this phenomenon

Table G2 shows the distribution of stipends for TAs, RAs, and full-support fellows. U.S. CS data are further broken down in this table by public and private institution. Figures GI-G3 further break down the U.S. CS data by size of department and by geographic location of the university.

The median TA salaries at U.S. CS departments increased 2.6 percent at public institutions while remaining flat at private institutions. Nevertheless, median TA salaries at private institutions are about one-third higher than at public institutions.

Median salaries of RAs rose were flat at public institutions but rose 3.8 percent at private institutions. For full-support fellows, median salaries fell 2.0 percent at U.S. public institutions and rose 6.9 percent at U.S. private institutions. Median salaries also are higher at private institutions for RAs (38 percent) and fullsupport fellows (21 percent).

Median stipends for TAs and RAs at U.S. I schools fall in between those at public and private U.S. CS departments, as has been the case for many years. Median stipends for full-support fellows at I schools also are in between those for public and private U.S. CS departments. Last year the I school value was the same as that for departments at public universities.

At U.S. CS departments, larger departments tend to have higher salaries than do smaller departments for TAs, RAs, and fullsupport fellows. The one exception is that the smallest public departments (those of size 15 or less) have higher TA (but not RA or full-support fellow) stipends than those of size 16-25.

Table Glb. Master's Students Eligibility for Assistantship Support

## Faculty Salaries

(Tables SI-S22; Figures SI-S9)
Each department was asked to report individual (but anonymous) faculty salaries if possible; otherwise, the department was requested to provide the mean salary for each rank (full, associate, and assistant professors and non-tenure-track teaching faculty, research faculty, and post-doctorates) and the number of persons at each rank. The salaries are those in effect on January l, 2021 for U.S. departments; nine-month salaries are reported in U.S. dollars. For Canadian departments, twelve-month salaries are reported in Canadian dollars. Respondents were asked to include salary supplements such as salary monies from endowed positions.
U.S. CS data is reported in Tables Sl-S16 and in the box and whiskers diagrams comprising Figures SI-S9. Data for CE, I, Canadian, and new Ph.D.s are reported in Tables SI7-S20. The tables and diagrams contain distributional data (first decile,
quartiles, and ninth decile) computed from the department averages only. Thus, for example, a table row labeled " 50 " or the median line in a diagram is the median of the averages for the departments that reported within the stratum (the number of such departments reporting is shown in the "depts" row). Therefore, it is not a true median of all of the salaries.

In these tables, we report salary data for senior faculty based on time in rank, for more meaningful comparison of individual or departmental faculty salaries with national averages. We report associate professor salaries for time in rank of 7 years or less, and of more than 7 years. For full professors, we report time in rank of 7 years or less, 8 to 15 years, and more than 15 years. We also disaggregate teaching faculty salaries into the two subclasses, Teaching Professors and Other Instructors. Within each subclass, there is further breakdown into persons with time in rank of less than 3 years, 3-5 years, 6-8 years, and 9 or more years. The teaching faculty salary disaggregations are in Tables Sla to SI9a.

Computing Research Association

Those departments reporting salary data were provided a summary report earlier this year, In the salary report, those departments that provided individual salaries were additionally provided more comprehensive distributional information based on these individual salaries.

The response rates from U.S. CS, U.S. CE, U.S. Information, and Canadian departments increased over last year's rates. This year's respective response rates for those departments were $74,14,68$ and 24 percent, giving an overall response rate of 61 percent. Last year's respective rates for the four department types were 73, 20, 68 and 31 percent, and the overall rate was 62 percent. As always, we urge caution in drawing conclusions from those categories with low response rates.

Of those departments reporting salary data this year, 62 percent provided salaries at the individual level. Last year, 63 percent did so.

Salaries at private institutions tend to be higher than those at public institutions for all faculty types (Tables S2 and S3). This pattern is consistent with data from previous years.

When viewed relative to faculty size, salaries tend to be higher for larger departments at both public and private institutions (perhaps best seen in Figures Sl-S9). This pattern holds for all tenure-track ranks. It also holds for teaching faculty, research faculty and postdoc salaries, with the exception of research faculty at public institutions.

When viewed relative to type of locale, public institution salaries appear to be generally lower in smaller locales than in mid-size or large cities for all tenure-track faculty ranks. Private institution salaries exhibit the opposite pattern, except for associate professors with 0-7 years in rank and assistant professors. Teaching faculty salaries at private institutions tend to be higher in large cities than in smaller locales, while teaching

faculty salaries at public institutions exhibit less of a clear trend (Figures SI-S7).

Our analysis of faculty salary changes from one year to the next uses only those departments that reported both years; otherwise, the departments that reported during only one year can skew the comparison. Because some departments that reported both years provided only aggregate salaries for their full and associate professors during one year and in the other year reported them by years in rank, we only report salary changes for all full professors and for all associate professors in the year-to-year comparison. Similarly, we do not disaggregate teaching faculty by years in rank in the year to year comparison, though we do distinguish teaching professors from other instructors. Table S21 shows, by type of faculty and type of department, the change in the median of the average salaries from departments that reported both years (the number of departments being
compared is indicated in parentheses in each column heading). Using the cell showing full professors at U.S. CS departments as an example, the table indicates that the median of the 127 average salaries for full professors was 1.2 percent higher in 2020-21 than was the median of the average full professor salaries in 2019-20 from these same 127 departments.

When interpreting salary changes, it is important to remember the effect that promotions have on the departmental data from one year to the next, since a promotion causes an individual faculty member to move from one rank to another. Thus, a department with a small number of faculty members in a particular rank can have its average salary in that rank change appreciably (in either direction) by a single promotion to or from that rank. Departures via resignation or retirement also impact these figures, particularly in the non-tenure-track categories. Because of the small number of Canadian schools, Information

schools, and Computer Engineering departments reporting, the values in those columns are considerably more volatile; this is evident in several of the entries in Table S21.

This year, salaries also were impacted by the financial effects of the COVID-19 pandemic. U.S. CS department salary changes for tenure-track were comparatively small this year. Tenure-track faculty increases were in the range of 1.1-1.5 percent depending on rank. To further illustrate the impact of the pandemic on salaries, we asked departments about salary freezes and furloughs. In Table S2la, for each department grouping, the column labeled " N " indicates how many departments in that group reported salary freeze and furlough information. The other columns show the percentage, of those who reported, who experienced a salary freeze for some or all faculty, furloughed some or all faculty during spring of academic year 2019-20, and
furloughed some or all faculty during academic year 2020-21. Salary freezes were experienced by more than half of the U.S. CS, U.S. CE, and U.S. I departments. Among U.S. CS departments, however, only 44 percent of those at public institutions reported freezes, while 91 percent of those at private institutions did so. Private institutions also differed from the other categories in that they did not experience furloughs in 2020-21, while between one in 5 and one in 7 departments of the other types did have furloughs. Only a few U.S. CS institutions reported furloughs for spring 2019-20. Only one Canadian institution reported a salary freeze for 2020-21 and none reported furloughs in either year.

For new Ph.D.s in tenure-track positions at U.S. computer science, computer engineering and I-school departments, the median of the averages was $\$ 116,118$, an increase of 3.2 percent over last year (Table S20). The median of the average

12-month salaries at Canadian institutions was \$110,000 CDN. However, only four institutions reported new Ph.D. salary data, so it is less clear how representative this value is across the population of Canadian doctoral granting institutions. Even fewer Canadian institutions reported new Ph.D. salaries last year, so no comparison is made between 2019 and 2020 for Canadian institutions.

Last year for the first time, we asked for the rate typically paid adjuncts for a single course, divided by whether the course was taught to undergraduate or graduate students, and whether the adjunct had a Ph.D. or a Masters degree. We repeated the question this year, and Table S22 shows the median course rate
for different types of institutions. Adjunct salaries were higher at private universities than at public universities, similar to the situation for other faculty salaries. Within public universities, larger cities tended to have lower salaries than smaller or midsized cities. At private universities, the same comparison held for adjuncts teaching undergrad courses, whether the adjunct had a Ph.D. or master's degree. Also of note is that, at U.S. CS departments, the median of the averages among those with master's degrees was higher for those who taught undergrad courses than for those who taught grad courses, although both sets of median salaries for those with master's degrees were below the respective medians for adjuncts with Ph.D.s.

Table S22. Median value for an adjunct teaching a single course.

| Group | Median <br> PhD <br> teaching <br> undergrad | N PhD <br> teaching <br> undergrad | Median <br> PhD <br> teaching <br> grad | N PhD <br> teaching <br> grad | Median MS <br> teaching <br> undergrad | N MS <br> teaching <br> undergrad | Median <br> MS <br> teaching <br> grad | N MS <br> teaching <br> grad |

## Concluding Observations

Pandemic or no pandemic, the demand for our computing programs remains high. The 2019-20 enrollment figures reported in this article are not affected by COVID, since they represent the fall of 2019, prior to the outbreak. Indeed, total enrollment per U.S. department in 2019-20 increased at all three degree levels.

The 2019-20 graduation values could have been affected by the pandemic, since students may have postponed graduation hoping a more normal/favorable employment climate would be available in 2021, or they may have been forced to postpone because of illness or issues associated with a virtual education environment. However, all three degree levels showed increases in degree production in U.S. departments.

The enrollment of new graduate students in 2020-21 reported in this article definitely appears to have been impacted by the pandemic, perhaps in combination with immigration issues that affect Nonresident Aliens. The data showed that new graduate student enrollment declined at both the master's and doctoral levels, and the big difference was among students from outside of North America. A seemingly large number of new students at both graduate levels deferred enrollment until 2021.

At the bachelor's level, which is less affected by Nonresident Alien enrollment, the situation was more nuanced. Overall bachelor's enrollment increased when aggregated across all reporting U.S. CS departments, but when looking only at those departments that reported both this year and last year, there was a decrease in enrollment.

There was small growth in tenure-track faculty size and a small decrease in supported TAs. But there was another year of double-digit percentage increase in full-time teaching faculty. Overall, the size of instructional staff seemed unaffected by the pandemic. However, COVID-related reasons certainly appeared to affect the success of faculty searches and cause some new hires to defer arrival, while salary freezes at many institutions and furloughs at some were the result of budgetary concerns related to the upheaval of the educational environment in response to COVID. Departments also were more modest In their expected faculty growth projections for the next two years.

Next year's survey will document the overall enrollment and graduation statistics during the 2020-21 academic year. With the expectation that in-person teaching returns to more normal levels in fall 2021, the survey also will document new student enrollment during a hopefully more typical teaching environment. We will be interested to see how this data compares with that reported this year. Next year's survey also will include questions asked only every three years, such as faculty teaching loads and number of support staff, that could offer a glimpse into any lingering personnel consequences of the past two years.

## Participating CS, CE, I and Canadian Departments

 (Departments marked with * have participated in all 5 of the most recent Taulbee surveys)U.S. CS Public (113): Arizona State*, Auburn*, Binghamton, Boise State, Clemson*, College of William \& Mary*, Colorado School of Mines*, Colorado State*, Florida International*, George Mason*, Georgia Tech*, Georgia State*, Indiana University Purdue University Indianapolis, Indiana*, Iowa State*, Kansas State*, Kent State*, Michigan State*, Michigan Technological University*, Mississippi State, Missouri University of Science and Technology, Montana State*, Naval Postgraduate School*, New Jersey Institute of Technology*, New Mexico State, North Carolina State*, North Dakota State*, Ohio State*, Ohio*, Oklahoma State*, Old Dominion, Oregon State*, Pennsylvania State*, Portland State*, Purdue*, Rutgers*, Southern Illinois (Carbondale)*, Stony Brook (SUNY)*, Temple, Tennessee Tech, Texas A\&M*, Texas State, Texas Tech*, University at Buffalo*, Universities of: Alabama (Birmingham* and Tuscaloosa), Arizona*, Arkansas*, Arkansas at Little Rock*, California (Berkeley*, Davis*, Irvine*, Los Angeles, Merced, Riverside*, San Diego*, Santa Barbara*, and Santa Cruz*), Colorado (Boulder)*, Connecticut*, Delaware*, Florida*, Houston*, Idaho, Illinois (Chicago* and Urbana-Champaign*), Iowa*, Kentucky, Louisiana at Lafayette*, Maine, Maryland (College Park* and Baltimore County*), Massachusetts (Amherst*), Memphis*, Michigan, Minnesota*, Missouri (Columbia), Nebraska (Omaha and Lincoln*), Nevada (Las Vegas and Reno*), New Hampshire*, New Mexico*, North Carolina (Chapel Hill* and Charlotte*), North Texas*, Oklahoma*, Oregon*, Pittsburgh*, Rhode Island*, South Carolina*, South Florida*, Southern Mississippi, Tennessee (Knoxville)*, Texas (Arlington*, Austin*, Dallas*, El Paso*, and

San Antonio), Utah*, Vermont, Virginia*, Washington*, Wisconsin (Madison*), Utah State, Virginia Commonwealth, Virginia Tech*,
Washington State*, Wayne State*, West Virginia, Western Michigan, and Wright State*.
U.S. CS Private (39): Boston University*, Brandeis*, Brown*, Carnegie Mellon*, Case Western Reserve*, Columbia, Cornell*, DePaul*, Drexel*, Duke*, Emory*, Florida Institute of Technology, George Washington, Harvard*, Illinois Institute of Technology, Johns Hopkins*, Lehigh*, MIT*, New York University*, Northeastern*, Northwestern*, NYU Tandon School*, Pace, Princeton*, Rensselaer*, Rice*, Rochester Institute of Technology*, Stanford*, Stevens Institute of Technology*, Toyota Technological Institute at Chicago*, Tufts*, Universities of: Chicago*, Notre Dame*, Pennsylvania*, Rochester*, and Southern

California*, Washington in St. Louis*, Worcester Polytechnic Institute*, and Yale.
U.S. CE (6): Boston University, Carnegie Mellon, Case Western Reserve, Iowa State, Universities of: Central Florida* and Illinois (Urbana-Champaign).
U.S. Information (16): Cornell*, Drexel*, Indiana*, Penn State*, Syracuse*, Universities of: Arizona, California (Berkeley)*, Cincinnati, Colorado (Boulder)*, Illinois (Urbana-Champaign)*, Maryland (College Park ISchool* and Baltimore County*), Michigan*, North Carolina (Chapel Hill)*, Pittsburgh*, and Washington*.

Canadian (8): McGill, Simon Fraser*, Universities of: Manitoba*, New Brunswick, Toronto*, Victoria, Waterloo*, York*.
${ }^{1}$ The title of the survey honors Orrin E. Taulbee of the University of Pittsburgh, who conducted these surveys for the Computer Science Board until 1984, with retrospective annual data going back to 1970.
${ }^{2}$ Information (I) programs included here are Information Science, Information Systems, Information Technology, Informatics, and related disciplines with a strong computing component. Surveys were sent to CRA members, the CRA Deans group members, and participants in the iSchools Caucus (www.ischools.org)who met the criteria of granting Ph.D.s and being located in North America. Other I programs who meet these criteria and would like to participate in the survey in future years are invited to contact survey@ cra.org for inclusion.
${ }^{3}$ Classification of the population of an institution's locale is in accordance with the Carnegie Classification database. Large cities are those with population $>=250,000$. Mid-size cities have population between 100,000 and 250,000 . Town/rural populations are less than 100,000.
${ }^{4}$ All faculty tables: The survey makes no distinction between faculty specializing in CS vs. CE programs. Every effort is made to minimize the inclusion of faculty in electrical engineering who are not computer engineers.
