## 2004-2005 Taulbee Survey

## Ph.D. Production at an All-Time High with More New Graduates Going Abroad; Undergraduate Enrollments Again Drop Significantly

By Stuart Zweben

This article and the accompanying figures and tables present the results of the 35 th annual CRA Taulbee Survey ${ }^{1}$ of Ph.D.-granting departments of computer science (CS) and computer engineering (CE) in the United States and Canada. This survey is conducted annually by the Computing Research Association to document trends in student enrollment, employment of graduates, and faculty salaries.
Information is gathered during the fall. Responses received by January 9, 2006 are included in the analysis. The period covered by the data varies from table to table. Degree production and enrollment (Ph.D., Master's, and Bachelor's) refer to the previous academic year (2004-2005). Data for new students in all categories refer to the current academic year (2005-2006). Projected student production and information on faculty salaries and demographics also refer to the current academic year. Faculty salaries are those effective January 1, 2006. The data were collected from Ph.D.-granting departments only. A total of 232 departments were surveyed, three more than last year. As shown in Figure 1, 188 departments returned their survey forms for a response rate of $81 \%$. This is down slightly from last year's tenyear record of $83 \%$, but is still quite comprehensive. The return rate of 10 out of 31 (32\%) for CE programs is very low, as has been customary. Many CE programs are part of an Electrical and Computer Engineering (ECE) department and do not keep separate statistics for CE vs. EE. In addition, many of these departments are not aware of the Taulbee Survey or its importance. The response rate for US CS departments ( 156 of 174 , or $90 \%$ ) again was very good, and there was a good response rate (22 of 27 , or $81 \%$ ) from Canadian departments.
The set of departments responding varies slightly from year to year, even when the total numbers are about the same; thus, we must approach any trend analysis with caution. We must be especially cautious in using the data about CE departments because
of the low response rate. However, we continue to report CE departments separately because there are some significant differences between CS and CE departments.
The survey form itself is modified slightly each year to ensure a high rate of return (e.g., by simplifying and clarifying), while continuing to capture the data necessary to understand trends in the discipline and also reflect changing concerns of the computing research community. New features this year include some details about Ph.D. employment outside North America (Table 4), data about numbers of new graduate students from outside North America (Tables 5-1 and 13), information about gender and ethnicity of research faculty and postdocs (Tables 21 and 22), and data about part-time faculty (Table 22-1).
Departments that responded to the survey were sent preliminary results about faculty salaries in December 2005; these results included additional distributional information not contained in this report. The CRA Board views this as a benefit of participating in the survey.
We thank all respondents who completed this year's questionnaire. Departments that participated are listed at the end of this article.

## Ph.D. Degree Production

 and Enrollments
## (Tables 1-8)

During 2004-2005, a total of 1,189 Ph.D. degrees were awarded by the 188 responding departments (Table 1). This is an increase of more than $15 \%$ over last year, and represents the highest Ph.D. production reported in a single academic year in the history of the Taulbee Survey. The previous record of 1,113 was set in 1992.
Last year's prediction by the departments that 1,480 Ph.D. degrees would be awarded in 2004-2005 was, as usual, overly optimistic. However, the "optimism ratio," defined as the actual over the predicted, was 0.80 , higher than last year's 0.76 . Based on previous experiences, the departments' prediction of 1,599 graduates for next year is likely to

## 2004-2005 Taulbee Survey

yield an actual production in the neighborhood of 1,250 . This still would result in another record crop of Ph.D.s.

The number of new students entering Ph.D. programs (Table 5) decreased from 2,887 to 2,749 (5\%). This follows an $8 \%$ decrease last year and a $5 \%$ decrease the previous year. Again this year the decrease is entirely in the U.S. programs, whose new Ph.D. enrollments are down more than 7\% (this statement is true even when the less reliable computer engineering data are removed from the U.S. totals). For the second straight year Canadian departments showed a $20 \%$ increase in new Ph.D students. While last year the increase was due to the specific set of schools that reported (whereas individual departments mainly experienced decreased enrollments), this year
there appears to be an increase in enrollment at most schools. For the first time, we requested information about the number of new students who come from outside North America. Table 5-1 reports the data for the fall 2005 class. Top-ranked U.S. departments have a somewhat higher fraction of domestic students than do lowerranked departments, and Canadian departments have a lower percentage of Ph.D. students from outside North America than do their U.S. counterparts. Trends from these data will not be visible for a while, but will be of interest to our community.
The number of students who passed qualifiers (Table 1) decreased during the past year from 2,318 to 2,059 ( $11 \%$ ), which follows a $50 \%$ increase last year. On a per-department basis, the number passing qualifiers

decreased from 12.3 to 11.1, but this still is well above the rate of 6.5 per department five years ago. The number who passed thesis proposal exams (Table 1) rose to 1,240 from $1,025(21 \%)$, on the heels of a $16 \%$ increase last year. While the thesis proposal data in this table are less comprehensive than other data about the Ph.D. pipeline, they also suggest a continued increase
in Ph.D. production for the short term. Total Ph.D. enrollment (Table 6) decreased slightly, from 14,234 to 13,958 (2\%), following two consecutive years of increases in the neighborhood of $20 \%$. If the decreases on the entrance end of the pipeline continue to balance or outweigh the increases at the exit, the increased production currently seen should end after a few years.

Figure 3 shows the longer-term trend of the number of CS Ph.D. graduates, normalized by the number of departments reporting to the Taulbee Survey. The figure also indicates the number of new students entering Ph.D. programs and the number of students who passed qualifiers. These also are normalized for the number of departments reporting. The graph offsets the qualifier data by one year from the data for new students, and offsets the graduation data by five years from the data for new students, to approximate the lag between student entrance into the pipeline and the qualifier and exit timeframe for the same cohort. This figure may be useful in predicting the timing of changes in

Ph.D. production rates.
Table 4 shows employment for new Ph.D. recipients. Of those who reported employment, $43 \%$ took academic employment in North America (compared to $60 \%$ last year and $63 \%$ the year before). Most of these academic positions again were in Ph.D.-granting departments, and once again a smaller percentage went into tenure-track positions ( $17.5 \%$ vs. $27.5 \%$ last year and $34.2 \%$ the year before). There was a significant increase this year in the number who went to other CS/CE departments ( 72 vs .31 in each of the past two years). Perhaps the increased total Ph.D. production, coupled with

he modest growth rate of faculty in Ph.D.-granting departments (discussed later in this report), is making it possible for non-Ph.D.-granting CS/CE departments to obtain a larger share of the supply of new Ph.D.s. This year there was a decrease (from 122 to 95 ) in the number of postdoctoral positions taken by new Ph.D.s. This is the opposite of the situation last year, and the number of new graduates taking postdoctoral positions this year is comparable to that of two years ago. Interestingly, the total number of postdocs in the academic departments ( 309 , see Table 17) actually rose slightly (from 295 last year), suggesting a multi-year nature to most postdoctoral assignments.
Figure 4 shows the employment trend of new Ph.D.s to academia and industry, and the proportion of those going to academia who took positions in other than Ph.D.-granting CS/CE departments. During the past two years, the gap has been closed between those taking academic jobs and those taking industry jobs, as economic conditions in industry improve. The situation still is not what it was during the dot-com boom years when industry employment exceeded that of academia.

Despite increased Ph.D. production, the proportion of new graduates who are reported as unemployed is a very low $1.5 \%$ and the proportion reported as "employment unknown" is similar to that of earlier years. However, the proportion (11.8\%) of Ph.D. graduates who were reported taking positions outside North America, among those whose employment is known, is considerably greater than at any time since the mid-90s (it was $4.5 \%$ last year, and ranged from $3.0 \%$ to $5.4 \%$ during the past eight years). This is the first evidence within the Taulbee Survey that globalization and offshoring is moving new graduates of Ph.D. programs away from the United States and Canada. It should be noted, however, that this survey question was changed this year to request more detailed information, and therefore some part of the reported increase in employment outside North America may be due to response differences.
The data in Table 4 also indicate the areas of specialty of new CS/CE Ph.D.s. Year-to-year fluctuations among these data are common. Multi-year trends are difficult to discern, though during the past decade the $\mathrm{AI} /$ robotics and programming languages/compiler areas generally have been on a declining trend, while the graphics/HCI area generally has been on an increasing trend.
The proportion of women among new Ph.D.s dropped from $18.0 \%$ in 2004 to $14.7 \%$ in 2005 (Table 2). The proportion of nonresident alien Ph.D.s rose from $48.2 \%$ in 2004 to $53.4 \%$ in 2005 (Table 3). There was an offsetting drop in the proportion of white, non-Hispanic and Asian/Pacific Islanders. African-American, NativeAmerican/Alaskan Native, and Hispanics collectively accounted for only $3.4 \%$ of the total, up slightly from $2.6 \%$ last year. The difference is mainly attributable to an increase in the proportion of Hispanics.
Current Ph.D. enrollment proportions are almost the same this year as last. However, there is a slight increase in the proportion of nonresident aliens in the Ph.D. programs ( $55.6 \%$ vs. $52.8 \%$ last year), and a slight decrease in the proportion of Asian/Pacific Islanders. This is despite the reports of declining applications from abroad to Ph.D. programs, at least in the United States. African-American and Hispanic proportions remain dismal, in the $1 \%$ to $2 \%$ range, and the proportion of Native Americans is even lower.

## Master's and Bachelor's Degree

 Production and Enrollments (Tables 9-16)Master's degree production (Tables 9,10) totaled 9,286 students, a decrease of 6\% (following an increase of $8 \%$ the previous year). This is reasonably consistent with the $8 \%$ drop in new Master's students two years ago. There also was a $17 \%$ drop in new Master's students reported in last year's survey. There was very little difference in gender and ethnicity characteristics of Master's recipients compared to last year's survey. Actual Master's degrees awarded exceeded last year's projections by only $10 \%$, compared to a $21 \%$ underestimate the previous year. This year's enrollment figures for Master's programs (Table 13) are about $2.5 \%$ greater than those of last year, while expected Master's production (Table 12) is $5 \%$ to $6 \%$ below last year's expectations. As we did with new Ph.D. students, this year we are able to report (Table 13) the count and proportion of new Master's students coming from outside North America. Among the 36 top-ranked U.S. departments the same trend noted among new Ph.D. students was observed, with top departments having a greater proportion of new domestic Master's students than lower-ranked departments. However, this trend was not evident for departments not ranked in the top 36. Canadian departments had a smaller proportion of non-North American new Master's students than did their U.S. counterparts, consistent with the observations for new Ph.D. students.
There were 18,232 Bachelor's degrees awarded in 2004-05 (Tables 9 and 10), a 13\% decrease compared to last year (following last year's $5 \%$ increase that was explained totally by the additional number of departments reporting compared to the previous year).

## 2004-2005 Taulbee Survey

|  | Actual | Projected |  | Expected Two-YearGrowth |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

| Other/Not Listed | 105 | 108 | 115 | 10 | 9.5\% |
| Total | 6,100 | 6,475 | 6,852 | 752 | 12.3\% |

|  | Tenure-track |  | Researcher |  | Postdoc |  | Teaching Faculty |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Male | 175 | 78.8\% | 31 | 77.5\% | 72 | 81.8\% | 37 | 68.5\% | 315 | 78.0\% |
| Female | 47 | 21.2\% | 9 | 22.5\% | 16 | 18.2\% | 17 | 31.5\% | 89 | 22.0\% |
| Total | 222 |  | 40 |  | 88 |  | 54 |  | 404 |  |

Graduation figures are now starting to reflect the results of the significantly decreased enrollments in our undergraduate programs that have been observed in the past two surveys and reported widely in the media. On top of the decreased overall production, there was a decreasing proportion of female Bachelor's degrees, from $17.0 \%$ in 2003-04 to $14.7 \%$ in 2004-05. There also was an increase, from $54.4 \%$ to $59.6 \%$, in the proportion of white, non-Hispanics receiving Bachelor's degrees, and a slight decrease in the proportion of Asian/Pacific Islanders receiving these degrees. These statistics indicate a continuing, and even increasing, diversity problem within our discipline.
Actual Bachelor's degree production in departments reporting this year was below the projection from last year's reporting departments by more than $7 \%$. Projected Bachelor's production for this year (Table 11) would forecast another $13 \%$ decrease, which is believable given the continued drop in enrollment. The number of new undergraduate majors dropped another $21 \%$, from 15,950 to 12,532 (see Table 14 and Figure 7). This follows last year's $10 \%$ drop in new majors and a $23 \%$ drop the year before that. Accounting for the fact that more departments are reporting to the survey now than did three years ago, we effectively have seen a halving of the number of new majors entering our programs over a threeyear period. Total enrollment in Bachelor's programs (Table 16) is down nearly $14 \%$ from last year and $30 \%$ compared to three years ago.
The number of new pre-majors in computer science is once again down considerably from last year ( $24 \%$, following a $20 \%$ drop last year), although the number of pre-majors in computer engineering rose by $21 \%$ this year. Because computer science programs dominate our survey, the net effect of these two changes is a decrease of $15 \%$ in total pre-major counts. It therefore is likely that the decreases in the number of undergraduate majors, at least in our computer science programs, will continue for another year.

## Faculty Demographics

(Tables 17-23)
Total faculty sizes continued to grow, at a $3 \%$ rate during the past year. Almost all of this increase is due

Figure 7. Newly Declared CS/CE Undergraduate Majors

to the $4 \%$ growth in tenure-track faculty, the dominant category. Other faculty categories are relatively flat compared to last year.
Table 4 shows 351 new Ph.D graduates known to have taken faculty positions at CS/CE Ph.D.granting departments. Tables 19 and 20 indicate that a total of 404 persons were hired during the past year. Thus, over $85 \%$ of the faculty hires made this past year by Ph.D.granting CS/CE departments appear to have been new Ph.D.s (about 10\% higher than last year), with the rest a combination of faculty who changed academic position, persons joining
academia from government and industry, new Ph.D.s from outside of North America and from disciplines outside of CS/CE, and non-Ph.D.holders (e.g., taking a teaching faculty appointment). As was the case last year, the fraction of tenuretrack hires who were new Ph.D.s appears to be over $80 \%$ ( 179 new Ph.D.s taking tenure-track faculty positions at Ph.D.-granting programs, and 222 new tenure-track faculty members hired by these programs).
This year's 3\% growth in total faculty size falls short of the $6 \%$ growth predicted by departments in last year's survey. After two

consecutive years of good predictions in this regard, over-optimism has crept back in. Thus, this year's prediction of $6 \%$ growth in total faculty size should be viewed with an appropriate degree of realism.
Table 23 on faculty "losses" shows an increase, from 75 last year to 103 (though less than $2 \%$ of all faculty), in the number who left academia this past year through death, retirement, or taking nonacademic positions. The retirement number went from 45 to 56. The amount of "churn," the number of professors moving from
one academic position to another, dropped from 87 to 61 .
The percentage of newly hired women faculty rose to $22 \%$ from $17 \%$ last year. This compares favorably with the $15 \%$ proportion of new female Ph.D.s shown in Table 2. A similar situation is noted when considering only new tenure-track faculty hires. The percentage of newly hired postdoctoral students who are women rose to $18 \%$ this year from $15 \%$ last year.
Ethnicity data for newly hired faculty, in general, mirror the trends
in the production of new Ph.D.s relative to the various ethnicity categories. The proportion of white, non-Hispanic hires decreased, while the proportion of nonresident aliens increased. However, the proportion of Asian/Pacific Islanders hired increased, while the proportion receiving Ph.D.s decreased. As has been observed for the past few years, disproportionally fewer nonresident aliens are being hired into tenure-track faculty positions ( $26 \%$ ) compared to nonresident aliens' proportion of the new Ph.D.s produced ( $53.4 \%$ ). The increased proportion of new Ph.D.s taking jobs abroad (reported earlier) no doubt is contributing to the widening of this gap from previous years.
This year, Tables 21 and 22 also show gender and ethnicity data of current research faculty and postdocs. Also new this year is Table 22-1, which reports data on part-time faculty.

Research Expenditures and Graduate Student Support (Tables 24-26)
Table 24-1 shows the department's total expenditure (including indirect
costs or "overhead" as stated on project budgets) from external sources of support. Table 24-2 shows the per capita expenditure, where capitation is computed two ways. The first is relative to the number of tenured and tenure-track faculty members, which also was the method used prior to last year's survey. The second is relative to researchers and postdocs as well as tenured and tenure-track faculty. The higher the ranking, the more external funding is received by the department (both in total and per capita). Canadian levels are shown in Canadian dollars.
The data show some interesting and perhaps surprising features this year. Mean and median expenditures, both in total and on a per capita basis (no matter which capitation method is used), actually declined for the U.S. top 12 departments and for departments ranked $25-36$. Doubledigit percent decreases were frequent among these groups. Means and median expenditures for departments ranked 13-24 and Canadian schools typically showed double-digit increases in total and per capita (though the maximum value among the Canadian schools declined),

while departments ranked greater than 36 showed increases in total expenditures and median capitation expenditures, but decreases in mean capitation expenditures (with a large decrease in the maximum capitation expenditures). Computer engineering expenditures generally declined, though the median of total expenditures rose slightly. These mixed reports suggest that it has become harder for faculty to obtain and/or sustain funding for computing research in the U.S. CRA has reported on the funding story extensively through the years, and these data are consistent with the declining state of research funding that has been noted recently.
Table 25 shows the number of graduate students supported as fulltime students as of fall 2005, further categorized as teaching assistants, research assistants, fellows, or computer systems supporters, and split between those on institutional vs. external funds. All categories of departments in the U.S. showed decreases in the number of teaching assistants (with higherranked departments showing the largest decreases), while Canadian departments showed increases. This
is the first year where the U.S. figures show a consistent story in teaching assistant employment, and likely reflects the decreased demands in the undergraduate programs within these departments.
The support for research assistants is somewhat mixed. Top 12 departments showed a considerable decline (over $20 \%$ ) in the number of externally supported research assistants, but this was somewhat offset by an increase in the number of research assistants supported on institutional funds. This pattern is consistent with the decline in research funding discussed above. In total, these departments supported $13.5 \%$ fewer research assistants compared to last year's survey. The number of full-support fellows declined by a similar amount.
For departments ranked 13-24, there were fewer externally funded research assistants and full-support fellows this year, but sufficiently more institutionally supported persons in these categories to compensate. It is interesting that external support of students declined for these departments although external research funding had increased last year. This may result from the
different time periods reflected in these two sets of data. External funding covers the most recently completed fiscal year, while the student support data are for the fall 2005 term.
Departments ranked 25-36 reported a significant increase in the number of externally funded research assistants, offset slightly by a decline in the number of institutionally supported research assistants. This is surprising in view of the decline in externally funded research for these departments. The number of fullsupport fellows for these departments held steady during the past year.
Departments ranked greater than 36 showed increased numbers of research assistants receiving support from both external and institutional sources, with some offsetting decreases in the number of fullsupport fellows in both categories. Canadian schools reported a significant increase in the number of full-support fellows. Institutionally supported research assistants also increased greatly, while externally supported research assistants declined by a comparable amount. Computer engineering departments reported a significant decline in externally
funded research assistants. However, the small number of such programs and their frequent combination with electrical engineering programs within these departments make these data less reliable.
Respondents were asked to "provide the net amount (as of fall 2005) of an academic-year stipend for a first-year doctoral student (not including tuition or fees)." The results are shown in Table 26. Canadian stipends are shown in Canadian dollars. Again this year, some median values increased while others decreased compared to last year's report. In strata showing a decrease, it appears to be because some departments within the stratum reported this information one year and not the other. With the exception of departments ranked 13-24, where median salaries for teaching assistants rose more than $7 \%$, any increases in graduate student salaries were modest.

## Faculty Salaries

## (Tables 27-34)

Each department was asked to report individual (but anonymous) faculty salaries if possible; otherwise,

## 2004-2005 Taulbee Survey

the department was requested to provide the minimum, median, mean, and maximum salaries for each rank (full, associate, and assistant professors and non-tenure-track teaching faculty) and the number of persons at each rank. The salaries are those in effect on January 1, 2006. For U.S. departments, ninemonth salaries are reported in U.S. dollars. For Canadian departments, twelve-month salaries are reported in Canadian dollars. Respondents were asked to include salary supplements such as salary monies from endowed positions.
Here we report tables comparable to those used in previous Taulbee surveys. The tables contain data about ranges and measures of central tendency only. Those departments reporting individual salaries were provided more comprehensive distributional information in December 2005. A total of 162 departments ( $86 \%$ of those reporting salary data) provided salaries at the individual level.
The minimum and maximum of the reported salary minima (and maxima) are self-explanatory. The range of salaries in a given rank among departments that reported data for that rank is the interval ["minimum of the minima," "maximum of the maxima"]. The mean of the reported salary minima (maxima) in a given rank is computed by summing the departmental reported minimum (maximum) and dividing by the number of departments reporting data at that rank.
The median salary at each rank is the middle of the list if you order its members' mean salaries at that rank from lowest to highest, or the average of the middle two numbers if there is an even number of items in the set. The average salary at each rank is computed by summing the individual means reported at each rank and dividing by the number of departments reporting at that rank. We recognize that these means and medians are only approximations to the true means and medians for their rank.
Overall U.S. CS average salaries (Table 27) increased between 3.7\% and $4.1 \%$, depending on tenure-track rank, and $4.8 \%$ for non-tenure-track teaching faculty. These increases compare favorably with the $2.5 \%$ to $3.3 \%$ levels experienced last year for tenure-track faculty and the $4.0 \%$ level for non-tenure-track teaching faculty. Departments ranked 13-24 gave the highest average increases at the assistant and full professor level (5.4\% each), while departments not ranked in the top 36 gave the highest increases to associate professors ( $4.0 \%$ ). Canadian salaries (shown as 12 -month salaries in Canadian dollars) rose $3.1 \%$ to $4.4 \%$ with the greater increase at the full professor rank and the smaller at the assistant professor rank.
Median salaries for new Ph.D.s (those who received their Ph.D. last year and then joined departments
as tenure-track faculty) increased $3.4 \%$ from those reported in last year's survey (Table 34). This level of increase is more in line with the average increases for continuing faculty, after two years of very smal increases for new Ph.D.s.

## Concluding Observations

As predicted last year, our field is producing Ph.D.s at a record rate, and the short-term forecast is for continued record production. While there is no evidence in our employment statistics that the increased production is resulting in an inability of Ph.D. graduates to find work, an increasing fraction of new Ph.D.s appear to be taking positions outside of North America. In the wake of accelerating globalization of the marketplace, this is not surprising.
Three consecutive years of decreasing numbers of new Ph.D. students, and a sharply reduced pipeline at the Bachelor's level will make it difficult to sustain this production rate in the longer term. Moreover, it is not yet clear when the decline in our undergraduate program enrollments will end. The double-digit percent decrease in bachelor's production observed this year is likely to continue for the next several years. Coupled with the declining representation of women in our undergraduate programs, our ability to produce a workforce that is sufficiently educated technically to meet the needs of the job market in computing is being severely challenged. The declining enrollments at the Bachelor's level also will increasingly challenge the ability of CS/CE departments to grow their faculty as they desire.

## Rankings

For tables that group computer science departments by rank, the rankings are based on information collected in the 1995 assessment of research and doctorate programs in the United States conducted by the National Research Council [see http://www.cra.org/statistics/ nrcstudy2/home.html].

The top twelve schools in this ranking are: Stanford, Massachusetts Institute of Technology, University of California (Berkeley), Carnegie Mellon, Cornell, Princeton, University of Texas (Austin), University of Illinois (Urbana-Champaign), University of Washington, University of Wisconsin (Madison), Harvard, and California Institute of Technology. All schools in this ranking participated in the survey this year.

## CS departments ranked 13-24

are: Brown, Yale, University of California (Los Angeles), University of Maryland (College Park), New York University, University of Massachusetts (Amherst), Rice, University of Southern California, University of Michigan, University of California (San Diego), Columbia,
and University of Pennsylvania. ${ }^{2}$ All schools in this ranking participated in the survey this year.

CS departments ranked 25-36 are: University of Chicago, Purdue Rutgers, Duke, University of North Carolina (Chapel Hill), University of Rochester, State University of New York (Stony Brook), Georgia Institute of Technology, University of Arizona, University of California (Irvine), University of Virginia, and Indiana. All schools in this ranking participated in the survey this year.

CS departments that are ranked above 36 or that are unranked that responded to the survey nclude: Arizona State University, Auburn, Boston University, Brandeis, Case Western Reserve, City University of New York Graduate Center, Clemson, College of William and Mary, Colorado School of Mines, Colorado State, Dartmouth, DePaul, Drexel, Florida Institute of Technology, Florida International, Florida State, George Mason, George Washington, Georgia State, Illinois Institute of Technology, Iowa State, Johns Hopkins, Kansas State, Kent State, Lehigh, Michigan State, Michigan Technological, Mississippi State, Montana State, Naval Postgraduate School, New Mexico State, North Carolina State, North Dakota State, Northeastern, Northwestern, Nova Southeastern, Ohio, Ohio State, Oklahoma State Old Dominion, Oregon State, Pace, Pennsylvania State, Polytechnic, Portland State, Rensselaer Polytechnic, Southern Methodist, State University of New York (Albany and Binghamton), Stevens Institute of Technology, Syracuse, Texas AㅋM, Texas Tech, Toyota Technological Institute Chicago), Tufts, Vanderbilt, Virginia Polytechnic, Washington State, Washington (St. Louis), Wayne State, West Virginia, Western Michigan, Worcester Polytechnic, and Wright State.

University of: Alabama
(Birmingham and Tuscaloosa), Arkansas (Little Rock), Buffalo, California (at Davis, Riverside, Santa Barbara, and Santa Cruz), Central Florida, Cincinnati, Colorado (at Boulder, Colorado Springs, and Denver), Connecticut, Delaware, Denver, Florida, Georgia, Hawaii, Houston, Illinois (Chicago), Iowa, Kansas, Kentucky, Louisiana (Lafayette), Maine, Maryland (Baltimore Co.), Massachusetts (at Boston and Lowell), Minnesota, Mississippi, Missouri (at Columbia, Kansas City and Rolla), Nebraska Lincoln and Omaha), Nevada (Las Vegas and Reno), New Hampshire, New Mexico, North Carolina (Charlotte), North Texas, Notre Dame, Oklahoma, Oregon, Pittsburgh, South Carolina, South Florida, Tennessee (Knoxville), Texas (at Arlington, Dallas, El Paso, and San Antonio), Toledo, Tulsa, Utah, Wisconsin (Milwaukee) and Wyoming.

Computer Engineering departments participating in the survey this year include: Georgia Institute of Technology, Northwestern, Princeton, Purdue, Rensselaer Polytechnic, and the Universities of Tennessee (Knoxville), California (Santa Cruz), Central Florida
Houston, and Southern California.

## Canadian departments

 participating in the surveyinclude: Carleton, Concordia, Dalhousie, McGill, Memorial, Queen's, Simon Fraser, and York universities. University of: Alberta, British Columbia, Calgary, Manitoba Montreal, New Brunswick, Ottawa, Regina, Saskatchewan, Toronto, Victoria, Waterloo, Western Ontario, and Universite Laval.

## Acknowledgments

Betsy Bizot once again provided valuable assistance with the data collection, tabulation, and analysis for this survey. Jean Smith suggested many valuable improvements to the presentation of this report

## Endnotes

1. The title of the survey honors the late Orrin E. Taulbee of the University of Pittsburgh, who conducted these surveys for the Computer Science Board until 1984, with retrospective annual data going back to 1970.
2. Although the University of Pennsylvania and the University of Chicago were tied in the National Research Council rankings, CRA made the arbitrary decision to place Pennsylvania in the second tier of schools. 3. All tables with rankings: Statistics sometimes are given according to departmental rank. Schools are ranked only if hey offer CS deree ad cooring the quality of their CS procerd to the qualty of their CS progan as determined by reputation. Those that only offer CE degrees are not ranked, and statistics are given on a separate line, apart from the rankings.
3. All ethnicity tables: Ethnic breakdowns are drawn from guidelines set forth by the U.S Department of Education.
4. All faculty tables: The survey makes no distinction between faculty specializing in CS vs. CE programs. Every effort is made to minimize the inclusion of faculty in electrical engineering who are not computer engineers.
